DTC P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B19, P1B1F, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01, P1E04

All of the following conditions exist:

- Vehicle ON.
- Vehicle speed is greater than 0.
- There is a change in the Voltage and Current readings.
- DTC U185A is not set.

Conditions for Setting the DTC

Battery Circuit

- P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B72, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B90, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, P1E8B are Type A DTCs.
- The hybrid/EV battery energy control module detects high resistance on the circuit.

Circuit Performance

- P0B3C, P0B41, P0B46, P0B4B, P0B50, P0B55, P0B5A, P0B5F, P0B64, P0B69, P0B6E, P0B73, P0B78, P0B7D, P0B82, P0B87, P0B8C, P0B91, P0B96, P0B9B, P0BA0, P0BA5, P0BAA, P0BAF, P0BB4, P0BB9, P1B19, P1B1F, P1B25, P1B45, P1B48, P1B4B, P1B4E, P1B51, P1B54, P1B57, P1B5A, P1B5D, P1B60, P1B63, P1B66, P1B69, P1B6C, P1B6F, P1B72, P1B75, P1B78, P1B7B, P1B7E, P1B81, P1B84, P1B87, P1B8A, P1B8D, P1B90, P1B93, P1B96, P1B99, P1B9C, P1B9F, P1BA2, P1BA5, P1BA8, P1BAB, P1BAE, P1BB1, P1BB4, P1BB7, P1BBA, P1BBD, P1BC0, P1BC3, P1BC6, P1BC9, P1BCC, P1BCF, P1BD2, P1BD5, P1BD8, P1BDB, P1BDE, P1BE1, P1BE4, P1BE7, P1BEA, P1BED, P1BF0, P1BF3, P1BF6, P1BF9, P1BFC, P1E01, P1E04 are Type A DTCs.
- The faulted cell group does not change voltage.

Low Voltage

- P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02, P1E05 are Type A DTCs.
- Any hybrid/EV battery voltage signal is less than 0.2 V.

High Voltage

- P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5, P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8, P1BFB, P1BFE, P1E03, P1E06 are Type A DTCs.
- Any hybrid/EV battery voltage signal is greater than 4.8 V.

Action Taken When the DTC Sets

- DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8B are type A DTCs.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and the extended range mode.

- Battery Circuit, Low Voltage or High Voltage DTCs set: Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will not CLOSE the high voltage contactors until the DTC has been cleared.

Conditions for Clearing the DTC

- DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06 or P1E4C-P1E8B are type A DTCs.
- Vehicle must be cycled from ON to OFF.

Diagnostic Aids

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.

Special Tools

- **EL-48571** High Voltage Battery Pin Out Box
- **EL-48571-55** Battery Pinout Box Adapter
- **EL-48900** HEV Safety Kit

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Record the freeze frame/failure records.
2. Vehicle in Service Mode.
3. Verify the scan tool Hybrid/EV Battery 1 - 96 voltages are between 3.45-4.05 V and all readings are within 0.03 V of each other.

- **If not between 3.45-4.05 V or not within 0.03 V of each other**

Refer to Circuit/System Testing.

- **If between 3.45-4.05 V and within 0.03 V of each other**

4. Clear the DTC and perform the [Clear Secured High Voltage DTCs](#) procedure.
5. Review and operate the vehicle according to the DTC Conditions for Running. Operate the vehicle for more than 10 minutes of city driving.
6. Verify the DTC does not reset.

- **If the DTC resets**

Refer to Circuit/System Testing.

- **If the DTC does not reset**

7. Plug-in the vehicle and charge the A4 Hybrid/EV Battery Pack.
8. Verify the DTC does not reset.

- **If the DTC resets**

Refer to Circuit/System Testing.

- **If the DTC does not reset**

9. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal

Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable high voltage at the A4 hybrid/EV battery pack. Refer to [High Voltage Disabling](#)
2. Remove the A4 hybrid/EV battery pack cover. Refer to [High Voltage Battery Cover Replacement](#)

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
 2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
 3. Disconnect and reconnect the battery energy control module connectors **ONLY** in the sequence provided in Repair Instructions.
3. Disconnect all K16 battery energy control module connectors in the sequence provided in Repair Instructions. Refer to [Battery Energy Control Module Replacement](#).
 4. Inspect the harness connectors and the K16 battery energy control module connectors for corrosion.

- If corrosion is present

Replace the Hybrid/EV Battery Pack Internal Harness and the K16 Battery Energy Control Module as applicable.

- If corrosion is not present

NOTE: The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.

5. Disconnect the harness connector at the appropriate C4 Hybrid/EV Battery Section harness connector as indicated by the voltages or DTCs observed during Circuit/System Verification.
6. Inspect the harness connector and the appropriate C4 Hybrid/EV Battery Section connector for corrosion.

- If corrosion is present

Replace the Hybrid/EV Battery Pack Internal Harness and the C4 Hybrid/EV Battery Section, as applicable.

- If corrosion is not present

7. Connect the **EL-48571** High Voltage Battery Pin Out Box with the **EL-48571-55** Battery Pinout Box Adapter to the appropriate battery section.
8. Insert the DMM probes into the **EL-48571** test cavities.
9. Measure and record the voltage of each of the cell groups by cycling the **EL-48571** through each of the switch positions. Refer to [EL-48571 High Voltage Battery Pin Out Box Reference](#)
10. Verify each cell group voltage reading is between 3.45-4.05 V.

- **If not within the specified range**

Replace the appropriate C4 Hybrid/EV Battery Section.

- **If within the specified range**

11. Verify each cell group voltage reading is within 0.03 V of each other.

- **If greater than 0.03 V**

Replace the appropriate C4 hybrid/EV battery section.

- **If 0.03 V or less**

NOTE: Perform the following testing at the hybrid/EV battery pack internal wiring harness connector.

12. Test for infinite resistance between each appropriate voltage sense circuit terminals and ground.

- **If less than infinite resistance**

Replace the Hybrid/EV Battery Pack Internal Harness.

- **If infinite resistance**

13. Test for less than 2 Ω in each appropriate voltage sense circuits end to end.

- **If 2 Ω or greater**

Replace the Hybrid/EV Battery Pack Internal Harness.

- **If less than 2 Ω**

14. Replace the appropriate C4 hybrid/EV battery section. Operate the vehicle and verify the DTC does not reset.

- **If the DTC resets**

Replace the K16 Battery Energy Control Module.

- **If the DTC does not reset**

15. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [High Voltage Section Battery Replacement \(Battery Section 1\)](#)[High Voltage Section Battery Replacement \(Battery Section 2\)](#)[High Voltage Section Battery Replacement \(Battery Section 3\)](#)
- Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
- Refer to [Auxiliary Battery Wiring Harness Replacement](#)
- Refer to [Control Module References](#) for hybrid/EV battery energy control module replacement, programming and setup.

DTC P0C78 OR P3061: HYBRID/EV BATTERY SYSTEM PRECHARGE TIME TOO LONG & HYBRID/EV BATTERY PRECHARGE HIGH CURRENT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0C78

Hybrid/EV Battery System Precharge Time Too Long

DTC P3061

Hybrid/EV Battery Precharge High Current

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors and 1 solid state relay (transistor). The high voltage contactors and transistor allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and a precharge negative high voltage contactor. The transistor controls the battery heater high voltage positive circuit. The contactors and transistor close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors/transistors. Ground is provided through the case ground.

In order to prevent large in-rush current, system bus high voltage is routed through a pre-charge resistor whenever high voltage is commanded ON. The hybrid/EV powertrain control module 2 monitors the time and current it takes the system bus voltage to attain the same level as the battery pack voltage. If it takes too long, or too much current flows, a DTC is set.

Conditions for Running the DTC

P0C78

- Battery voltage sensor has not failed.
- Bus voltage sensor has not failed.

P3061

- Battery voltage sensor has not failed.
- Battery current sensor has not failed.
- Precharge is active.

Conditions for Setting the DTC

P0C78

The bus voltage has not reached 95% of battery voltage within 700 ms of the contactors closing.

P3061

The bus current is greater than 3 amps for 88 ms during precharge.

Actions Taken When the DTC Sets

- DTC P0C78 and P3061 are type A DTCs.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

DTC P0C78 and P3061 are type A DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Record the freeze frame/failure records.
2. Vehicle in Service Mode.
3. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE4, P0D0A, or P1EC3 is not set.
 - **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If none of the DTCs are set**

NOTE: The following setup steps must be performed exactly in order to exercise the contactors.

4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. OPEN the driver door using outside door handle. Leave driver door OPEN.

NOTE: The brake pedal must remain depressed throughout the remainder of the contactor steps.

6. PRESS and HOLD the brake pedal.

NOTE: DO NOT press the power button and enter Vehicle in Service Mode.

7. Command the Hybrid/EV Battery Contactors ALL OPEN with a scan tool.
8. Disconnect the S15 Manual Service Disconnect.

NOTE: DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning.

9. Command the Hybrid/EV Battery Negative Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

NOTE: It is normal for the contactor to make noise only when opening.

10. Verify the Hybrid/EV Battery Negative Contactor should be heard closing and opening.

- If the Hybrid/EV Battery Negative Contactor does not open and close

Refer to Circuit/System Testing, Contactor Function Diagnosis.

- If the Hybrid/EV Battery Negative Contactor does open and close

11. Command the Hybrid/EV Battery Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

NOTE: It is normal for the contactor to make noise only when opening.

12. Verify the Hybrid/EV Battery Positive Contactor should be heard closing and opening.

- If the Hybrid/EV Battery Positive Contactor does not open and close

Refer to Circuit/System Testing, Contactor Function Diagnosis.

- If the Hybrid/EV Battery Positive Contactor does open and close

13. Command the Hybrid/EV Battery Precharge Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

NOTE: It is normal for the contactor to make noise only when opening.

14. Verify the Hybrid/EV Battery Precharge Contactor should be heard opening and closing.

- If the Hybrid/EV Battery Precharge Contactor does not open and close

Refer to Circuit/System Testing, Contactor Function Diagnosis.

- **If the Hybrid/EV Battery Precharge Contactor does open and close**

15. Command the Hybrid/EV Battery Charger Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open.

NOTE: It is normal for the contactor to make noise only when opening.

16. Verify the Hybrid/EV Battery Charger Contactor should be heard opening and closing.

- **If the Hybrid/EV Battery Charger Contactor does not open and close**

Refer to Circuit/System Testing, Contactor Function Diagnosis.

- **If the Hybrid/EV Battery Charger Contactor does open and close**

17. Test for less than 10 Ω across the S15 manual service disconnect fuse terminals.

- **If 10 Ω or greater**

Obtain a new S15 manual service disconnect and Refer to Circuit/System Testing, High Voltage System Bus Diagnosis without DTC P0D26.

- **If less than 10 Ω**

18. Vehicle OFF.

19. Install the S15 Manual Service Disconnect.

20. Clear the DTC Information. Vehicle OFF and wait 5 minutes. Vehicle ON, verify DTC P0C78 or P3061 do not set.

- **If any of the DTCs are set**

NOTE: The vehicle must remain OFF to prevent DTC P0C78 and P3061 from running.

1. Vehicle OFF.

2. Wait 5 minutes.

3. Connect the drive motor battery charger cable.

4. Verify DTC P0D26 is not set and the vehicle will charge.

- If the DTC is set and the vehicle will not charge, refer to Circuit/System Testing, High Voltage System Bus Diagnosis with DTC P0D26.
- If the DTC is not set and the vehicle charges, refer to Circuit/System Testing, High Voltage System Bus Diagnosis without DTC P0D26.

- **If none of the DTCs are set**

21. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal

protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

Contactor Function Diagnosis

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
3. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - **If more than 10 Ω**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
4. Verify that a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K16 Battery Energy Control Module and A28 Hybrid/EV Battery Contactor Assembly.
 - **If the test lamp illuminates**
5. Vehicle OFF, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack. Vehicle in Service Mode.
6. Verify that a test lamp does not illuminate between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:
 - Terminal 2 X357
 - Terminal 4 X357

- Terminal 6 X357

- Terminal 7 X357

- **If the test lamp illuminates on any circuit**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.

2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.

- **If the test lamp does not illuminate on all circuits**

7. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.

8. Test for infinite resistance between each A4 Hybrid/EV Battery Pack harness connector control circuit terminals listed below and ground:

- Terminal 2 X357
- Terminal 4 X357
- Terminal 6 X357
- Terminal 7 X357

- **If less than infinite resistance on either circuit**

Repair the short to ground on the circuit.

- **If infinite resistance on both circuits**

9. Test for less than 2 Ω between the harness connector terminals listed below:

- Terminal 2 X357 at the A4 Hybrid/EV Battery Pack and terminal 9 X1 at the K114B Hybrid Powertrain Control Module 2
- Terminal 4 X357 at the A4 Hybrid/EV Battery Pack and terminal 6 X1 at the K114B Hybrid Powertrain Control Module 2
- Terminal 6 X357 at the A4 Hybrid/EV Battery Pack and terminal 8 X1 at the K114B Hybrid Powertrain Control Module 2
- Terminal 7 X357 at the A4 Hybrid/EV Battery Pack and terminal 3 X1 at the K114B Hybrid Powertrain Control Module 2

- **If 2 Ω or greater on any circuit**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω on all circuits**

10. Replace the A28 Hybrid/EV Battery Contactor Assembly.

11. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- **If DTC P0C78 or P3061 sets**

Replace the K114B Hybrid Powertrain Control Module 2.

- **If DTC P0C78 or P3061 does not set**

12. All OK.

High Voltage System Bus Diagnosis with P0D26

1. Disable the high voltage for servicing at the A4 Battery Pack, K1 14V Power Module and the T18 Battery

Charger. Refer to [High Voltage Disabling](#).

2. Disconnect the X3 connector at the T18 Battery Charger and the X4 connector at the K1 14V Power Module.
3. Verify that all HV harness connector and mating module connector terminals are free from moisture, corrosion and arc flash damage.

- **If any terminals show signs of damage**

Replace the HV wiring harness and effected modules as necessary.

- **If no arc flash damage, moisture, or corrosion is found**

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.

4. Test the K1 14 V Power Module X4 terminals for greater than 10K Ω , X4-A to X4-B.

- **If 10K Ω or less**

1. Replace the K1 14V Power Module.

2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC P0C78 or P3061 sets, replace the A28 Hybrid/EV Battery Contactor Assembly.
- If DTC P0C78 or P3061 does not set

3. All OK.

- **If greater than 10K Ω**

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.

5. Test the T18 Battery Charger terminals for greater than 10K Ω , X3-1 to X3-2.

- **If 10K Ω or less**

1. Replace the T18 Battery Charger.

2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC P0C78 or P3061 sets, replace the A28 Hybrid/EV Battery Contactor Assembly.
- If DTC P0C78 or P3061 does not set

3. All OK.

- **If greater than 10K Ω**

6. Remove and open the A4 Battery Pack. Refer to [High Voltage Battery Cover Replacement](#).

7. Inspect the High Voltage bus bars for loose/damaged terminal fasteners.

- **If a terminal concern is found**

Replace all affected components.

- **If no internal concerns are observed**

8. Replace the A28 Hybrid/EV Battery Contactor Assembly.

9. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running

the DTC.

- **If DTC P0C78 or P3061 sets**

Replace the K114B Hybrid Powertrain Control Module 2.

- **If DTC P0C78 or P3061 does not set**

10. All OK.

High Voltage System Bus Diagnosis without P0D26

1. Disable the high voltage for servicing at the A4 Battery Pack, G1 A/C Compressor, T6 Power Inverter Module and the K10 Coolant Heater. Refer to [High Voltage Disabling](#).
2. Disconnect the X2 connector at the T6 Power Inverter Module, the X3, X4 and X5 connectors at the A4 Battery Pack, the X2 connector at the K10 Coolant Heater and the X2 connector at the G1 A/C Compressor.
3. Verify that all HV harness connector and mating module connector terminals are free from moisture, corrosion and arc flash damage.

- **If any terminals show signs of damage**

Replace the HV wiring harness and effected modules as necessary.

- **If no arc flash damage, moisture, or corrosion is found**

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.

4. Test the T6 Power Inverter Module X2 terminals for greater than 10K Ω , X2-A to X2-B.

- **If 10K Ω or less**

1. Replace the T6 Power Inverter Module.

2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC P0C78 or P3061 sets, replace the A28 Hybrid/EV Battery Contactor Assembly.
- If DTC P0C78 or P3061 does not set

3. All OK.

- **If greater than 10K Ω**

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.

5. Test the K10 Coolant Heater X2 terminals for greater than 10K Ω , X2-1 to X2-2.

- **If 10K Ω or less**

1. Replace the K10 Coolant Heater Control Module.

2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC P0C78 or P3061 sets, replace the A28 Hybrid/EV Battery Contactor Assembly.
- If DTC P0C78 or P3061 does not set

3. All OK.

- If greater than 10K Ω

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value. You must measure with a high-impedance Digital Multimeter (DMM). DO NOT use the EL-50772 to measure insulation resistance.

6. Test the G1 A/C Compressor X2 terminals for greater than 10K Ω , X2-A to X2-B.

- If 10K Ω or less

1. Replace the G1 A/C Compressor.

2. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC P0C78 or P3061 sets, replace the A28 Hybrid/EV Battery Contactor Assembly.
- If DTC P0C78 or P3061 does not set

3. All OK.

- If greater than 10K Ω

7. Remove and open the A4 Battery Pack. Refer to [High Voltage Battery Cover Replacement](#).

8. Inspect the High Voltage bus bars for loose/damaged terminal fasteners.

- If a terminal concern is found

Replace all affected components.

- If no internal concerns are observed

9. Replace the A28 Hybrid/EV Battery Contactor Assembly and the K16 Battery Energy Control Module.

10. Verify that DTC P0C78 or P3061 does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC P0C78 or P3061 sets

Replace the K114B Hybrid Powertrain Control Module 2.

- If DTC P0C78 or P3061 does not set

11. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [High Voltage Battery Disconnect Relay Replacement](#) for A28 Hybrid/EV Battery Contactor Assembly
- Refer to [Air Conditioning and Drive Motor Battery Cooling Compressor Replacement](#) for G1 A/C compressor
- Refer to [Heater Coolant Heater Replacement](#) for K10 Coolant Heater
- Refer to [Control Module References](#) for T6 power inverter module, K1 14V Power Module, T18 battery charger, battery energy control module, or hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P3040

Hybrid/EV Battery Interface Control Module 12.5 V Reference Circuit

Circuit/System Description

The hybrid battery contains 192 individual cells. Two cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cell groups are joined to form 3 distinct sections. The first 24 battery cell groups make up battery section 1. This section is adjacent to the cowl and contains battery cell groups 73 through 96. The next 28 battery cell groups make up battery section 2. This section is located behind section 1 and contains battery cell groups 45 through 72. The transverse battery section is section number 3 and it contains the remaining 44 battery cell groups 1 through 44. The battery sections also contain two temperature sensors, with one sensor located at each end of the section.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A voltage sense harness joins this connector to the battery energy control module.

The battery energy control module contains internal interface control modules that monitor specific cell groups.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

P1A07

- The battery energy control module is awake and communicating.
- The 12 V battery voltage greater than or equal to 9 V.

P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040

- The battery energy control module is awake and communicating.
- None of the following DTCs are set; U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, U2624

Conditions for Setting the DTC

P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040

The battery energy control module has detected an internal 5V reference circuit voltage is less than 2.8 V or greater than 3.2 V.

Actions Taken When the DTC Sets

- DTCs P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040 are Type A DTCs.
- The vehicle will operate in a reduced power mode and the extended range mode.

Conditions for Clearing the DTC

DTCs P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, and P3040 are Type A DTCs.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that DTC P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, or P3040 is not set.
 - If DTC P1A07, P1E93, P1E99, P1E9F, P1EA5, P1FC3, P1FC4, P1FC5, P1FC6, P1FC7, P1FC8, P3035, or P3040 is set
 1. Disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling.
 2. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to Battery Energy Control Module Replacement.
 - If none of the DTCs are set
2. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for battery energy control module programming and setup.

DTC P3036

Hybrid/EV Battery Interface Control Module 11 Cell Balancing Circuit

DTC P3041

Hybrid/EV Battery Interface Control Module 12 Cell Balancing Circuit

Circuit/System Description

To maintain a similar state of charge on the cell groups, the hybrid/EV powertrain control module 2 looks at the cell group voltages and determines which cell groups need energy removed in order to maintain the battery groups at a similar state of charge. This is known as cell balancing. There is a transistor switched resistor wired in parallel with the cell group internal to the hybrid/EV battery interface control module portion of the battery energy control module. The hybrid/EV powertrain control module 2 sends a command to the hybrid/EV battery energy control module to begin cell balancing.

Conditions for Running the DTC

- The hybrid/EV battery energy control module is awake and communicating.
- The high voltage fault circuit diagnostic is not running.
- The cell balancing circuit is greater than 3.0 V.
- None of the following DTCs are set, P1E8E, P1E94, P1E9A, P1EA0, P1FBD, P1FBE, P1FBF, P1FC0, P1FC1, P1FC2, P3037, P3042, U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, or U2624.

Conditions for Setting the DTC

The battery energy control module has detected an internal cell balancing switch fault.

Actions Taken When the DTC Sets

- DTCs P1E92, P1E98, P1E9E, P1EA4, P1FC9, P1FCA, P1FCB, P1FCC, P1FCD, P1FCE, P3036, and P3041 are Type A DTCs.
- Cell balancing is disabled.
- The vehicle will operate in a reduced power mode and the extended range mode.

Conditions for Clearing the DTC

DTCs P1E92, P1E98, P1E9E, P1EA4, P1FC9, P1FCA, P1FCB, P1FCC, P1FCD, P1FCE, P3036, and P3041 are Type A DTCs.

DTC P1EAB OR P1EAC: BATTERY ENERGY CONTROL MODULE HYBRID/EV BATTERY CELL HIGH VOLTAGE & HYBRID/EV BATTERY CELL OVERVOLTAGE SIGNAL CIRCUIT PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1EAB

Battery Energy Control Module Hybrid/EV Battery Cell High Voltage

DTC P1EAC

Circuit/System Description

The 2nd protection is a redundant method to monitor cell group overvoltage. The 2nd protection circuit is the actual hardware signal from the hybrid/EV battery energy control module to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 monitors this line to determine when a cell group overvoltage condition exists, independently of the cell group diagnostic trouble codes transmitted via serial data from the battery energy control module to the hybrid powertrain control module 2.

The 2nd protection self test diagnostic is used to check the signal circuit. The hybrid/EV battery energy control module performs this test, once, every power up cycle. When run/crank input signal transitions high and after a calibrated delay, the hybrid/EV battery energy control module informs the hybrid/EV powertrain control module 2, via serial data communication bus that it is about to run the diagnostics on the 2nd protection circuit. The hybrid/EV battery energy control module then proceeds to command, via internal serial data, each of its internal hybrid/EV battery interface control modules to run the check on its hardware output. Each of the four hybrid/EV battery interface control modules pulls the signal circuit low and releases it, in sequence. If any pulses are missing, the hybrid/EV battery energy control module sets a related fault, and sends this information to the hybrid/EV powertrain control module 2 on the serial data. Additionally, the hybrid powertrain control module 2 monitors the 2nd protection circuit for opens, shorts to ground and shorts to voltage.

Conditions for Running the DTC

P1EAB

- The hybrid/EV battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- DTC P0B3D, P0B42, P0B47, P0B4C, P0B51, P0B56, P0B5B, P0B60, P0B65, P0B6A, P0B6F, P0B74, P0B79, P0B7E, P0B83, P0B88, P0B8D, P0B92, P0B97, P0B9C, P0BA1, P0BA6, P0BAB, P0BB0, P0BB5, P0BBA, P1B17, P1B1A, P1B1D, P1B20, P1B23, P1B26, P1B46, P1B49, P1B4C, P1B4F, P1B52, P1B55, P1B58, P1B5B, P1B5E, P1B61, P1B64, P1B67, P1B6A, P1B6D, P1B70, P1B73, P1B76, P1B79, P1B7C, P1B7F, P1B82, P1B85, P1B88, P1B8B, P1B8E, P1B91, P1B94, P1B97, P1B9A, P1B9D, P1BA0, P1BA3, P1BA6, P1BA9, P1BAC, P1BAF, P1BB2, P1BB5, P1BB8, P1BBB, P1BBE, P1BC1, P1BC4, P1BC7, P1BCA, P1BCD, P1BD0, P1BD3, P1BD6, P1BD9, P1BDC, P1BDF, P1BE2, P1BE5, P1BE8, P1BEB, P1BEE, P1BF1, P1BF4, P1BF7, P1BFA, P1BFD, P1E02, P1E05, P0B3E, P0B43, P0B48, P0B4D, P0B52, P0B57, P0B5C, P0B61, P0B66, P0B6B, P0B70, P0B75, P0B7A, P0B7F, P0B84, P0B89, P0B8E, P0B93, P0B98, P0B9D, P0BA2, P0BA7, P0BAC, P0BB1, P0BB6, P0BBB, P1B18, P1B1B, P1B1E, P1B21, P1B24, P1B27, P1B47, P1B4A, P1B4D, P1B50, P1B53, P1B56, P1B59, P1B5C, P1B5F, P1B62, P1B65, P1B68, P1B6B, P1B6E, P1B71, P1B74, P1B77, P1B7A, P1B7D, P1B80, P1B83, P1B86, P1B89, P1B8C, P1B8F, P1B92, P1B95, P1B98, P1B9B, P1B9E, P1BA1, P1BA4, P1BA7, P1BAA, P1BAD, P1BB0, P1BB3, P1BB6, P1BB9, P1BBC, P1BBF, P1BC2, P1BC5, P1BC8, P1BCB, P1BCE, P1BD1, P1BD4, P1BD7, P1BDA, P1BDD, P1BE0, P1BE3, P1BE6, P1BE9, P1BEC, P1BEF, P1BF2, P1BF5, P1BF8, P1BFB, P1BFE, P1E03, P1E06, P0B3B, P0B40, P0B45, P0B4A, P0B4F, P0B54, P0B59, P0B5E, P0B63, P0B68, P0B6D, P0B77, P0B7C, P0B81, P0B86, P0B8B, P0B95, P0B9A, P0B9F, P0BA4, P0BA9, P0BAE, P0BB3, P0BB8, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E86, P1E87, P1E88, P1E89, P1E8A, U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, U2624, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, P1FA6, P1FA7, P1FA8, P1FA9, P1FAA, P1FAB, P3030, P303B, U0111, or U185A is not set
- The 12 V battery voltage is greater than or equal to 10.2 V.
- Vehicle must be cycled from Vehicle OFF to Vehicle ON.

- Vehicle is ON for greater than 5 seconds.
- Hybrid powertrain control module 1 detects high voltage bus is greater than 312 V.
- Battery charging is not active.

P1EAC

- The hybrid/EV battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- DTC U0111 or U185A is not set.
- The 12 V battery voltage greater than or equal to 10.2 V.
- Vehicle must be cycled from Vehicle OFF to Vehicle ON.
- Vehicle is ON for greater than 5 seconds.

Conditions for Setting the DTC

P1EAB

A cell group voltage of greater than 4.5 V is detected.

OR

The hybrid powertrain control module 2 has detected a fault with the 2nd protection circuit.

P1EAC

The hybrid/EV powertrain control module 2 has detected a fault with the 2nd protection circuit.

Action Taken When the DTC Sets

- DTCs P1EAB and P1EAC are type A DTCs.
- If any of these DTCs are set, the vehicle will operate in a reduced power mode and the extended range mode.

P1EAB

Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will not CLOSE the high voltage contactors until the DTC has been cleared.

Conditions for Clearing the DTC

- DTCs P1EAB and P1EAC are type A DTCs.
- Vehicle Power cycled from ON to OFF after code clear.

P1EAB

After the repair for DTC P1EAB, with a scan tool, perform the **Clear Secured High Voltage DTCs** repair instruction.

Diagnostic Aids

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. **Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.**
2. **Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.**
3. **Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.**

The Hybrid/EV Battery Section schematics in Energy Storage identify the battery section and voltage sense circuit terminal locations appropriate to each cell group and corresponding DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0B3B, P0B3D, P0B3E, P0B40, P0B42, P0B43, P0B45, P0B47, P0B48, P0B4A, P0B4C, P0B4D, P0B4F, P0B51, P0B54, P0B52, P0B56, P0B57, P0B59, P0B5B, P0B5C, P0B5E, P0B60, P0B61, P0B63, P0B65, P0B66, P0B68, P0B6A, P0B6B, P0B6D, P0B6F, P0B70, P0B72, P0B74, P0B75, P0B77,

P0B79, P0B7A, P0B7C, P0B7E, P0B7F, P0B81, P0B83, P0B84, P0B86, P0B88, P0B89, P0B8B, P0B8D, P0B8E, P0B90, P0B92, P0B93, P0B95, P0B97, P0B98, P0B9A, P0B9C, P0B9D, P0B9F, P0BA1, P0BA2, P0BA4, P0BA6, P0BA7, P0BA9, P0BAB, P0BAC, P0BAE, P0BB0, P0BB1, P0BB3, P0BB5, P0BB6, P0BB8, P0BBA, P0BBB, P1B17, P1B18, P1B1A, P1B1B, P1B1D, P1B1E, P1B20, P1B21, P1B23, P1B24, P1B26, P1B27, P1B28, P1B29, P1B2A, P1B2B, P1B2C, P1B2D, P1B46, P1B47, P1B4A, P1B4C, P1B4D, P1B4F, P1B50, P1B52, P1B53, P1B55, P1B56, P1B58, P1B59, P1B5B, P1B5C, P1B5E, P1B5F, P1B61, P1B64, P1B62, P1B65, P1B67, P1B68, P1B6A, P1B6B, P1B6D, P1B6E, P1B70, P1B71, P1B73, P1B74, P1B76, P1B77, P1B79, P1B7A, P1B7C, P1B7D, P1B7F, P1B80, P1B82, P1B83, P1B85, P1B86, P1B88, P1B89, P1B8B, P1B8C, P1B8E, P1B8F, P1B91, P1B92, P1B94, P1B95, P1B97, P1B98, P1B9A, P1B9B, P1B9D, P1B9E, P1BA0, P1BA1, P1BA3, P1BA4, P1BA6, P1BA7, P1BA9, P1BAA, P1BAC, P1BAD, P1BAF, P1BB0, P1BB2, P1BB3, P1BB5, P1BB6, P1BB8, P1BB9, P1BBB, P1BBC, P1BBE, P1BBF, P1BC1, P1BC2, P1BC4, P1BC5, P1BC7, P1BC8, P1BCA, P1BCB, P1BCD, P1BCE, P1BD0, P1BD1, P1BD3, P1BD4, P1BD6, P1BD7, P1BD9, P1BDA, P1BDC, P1BDD, P1BDF, P1BE0, P1BE2, P1BE3, P1BE5, P1BE6, P1BE8, P1BE9, P1BEB, P1BEC, P1BEE, P1BEF, P1BF1, P1BF2, P1BF4, P1BF5, P1BF7, P1BF8, P1BFA, P1BFB, P1BFD, P1BFE, P1E02, P1E03, P1E05, P1E06, P1E4C, P1E4D, P1E4E, P1E4F, P1E50, P1E51, P1E52, P1E53, P1E54, P1E55, P1E56, P1E57, P1E58, P1E59, P1E5A, P1E5B, P1E5C, P1E5D, P1E5E, P1E5F, P1E60, P1E61, P1E62, P1E63, P1E64, P1E65, P1E66, P1E67, P1E68, P1E69, P1E6A, P1E6B, P1E6C, P1E6D, P1E6E, P1E6F, P1E70, P1E71, P1E72, P1E73, P1E74, P1E75, P1E76, P1E77, P1E78, P1E79, P1E7A, P1E7B, P1E7C, P1E7D, P1E7E, P1E7F, P1E80, P1E81, P1E82, P1E83, P1E84, P1E85, P1E86, P1E87, P1E88, P1E89, P1E8A, U2603, U2604, U2605, or U2606 is not set.

- If any of the DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- If none of the DTCs are set

3. Verify that DTC P1EAB or P1EAC is not set.

- If DTC P1EAB or P1EAC is set

Refer to Circuit/System Testing

- If DTC P1EAB or P1EAC is not set

4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.

- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle in Service Mode.
2. Verify the hybrid/EV powertrain control module 2 scan tool Maximum Hybrid/EV Battery Module Voltage parameter is 4.5 V or less.

- **If greater than 4.5 V**

Perform the applicable DTC diagnosis for the battery module indicating high voltage. Refer to [DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, or P1E4C-P1E8B.](#)

- **If 4.5 V or less**

3. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling.](#)

NOTE: Connecting the 12 V battery with the manual service disconnect removed will set DTCs.

4. Connect the 12 V battery. Disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack. Vehicle in Service Mode.

5. Test for 4.8 - 5.2 V between the signal circuit terminal 6 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid Powertrain Control Module 2.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid Powertrain Control Module 2. After the repair, with a scan tool, perform the [Clear Secured High Voltage DTCs](#) repair instruction.

- **If 5.2 V or greater**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2. After the repair, with a scan tool, perform the [Clear Secured High Voltage DTCs](#) repair instruction.

- **If between 4.8 - 5.2 V**

6. Vehicle OFF, remove the A4 Hybrid/EV Battery Pack Cover. Refer to [High Voltage Battery Cover Replacement.](#)
7. Connect **EL-50211** Low Voltage Jumper Harness Extension. Disconnect the X8 harness connector at the K16 Battery Energy Control Module. Vehicle in Service Mode.
8. Test for 4.8 - 5.2 V between the signal circuit terminal 8 and ground.

- **If not within the specified range**

Repair or replace the Hybrid/EV Battery Pack Internal Harness. After the repair, with a scan tool, perform the [Clear Secured High Voltage DTCs](#) repair instruction.

- **If within the specified range**

9. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to [Battery Energy Control Module Replacement](#).

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Auxiliary Battery Wiring Harness Replacement](#) for Hybrid/EV Battery Pack Internal Harness replacement
- Refer to [Control Module References](#) for battery energy control module or hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1FD5-P1FF2, P3038-P303A, OR P3043-P3045: HYBRID/EV BATTERY INTERFACE CONTROL MODULE 1-12 VOLTAGE SENSOR(S)

Circuit/System Description

The hybrid battery contains 192 individual cells. Two cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cell groups are joined to form 3 distinct sections. The first 24 battery cell groups make up battery section 1. This section is adjacent to the cowl and contains battery cell groups 73 through 96. The next 28 battery cell groups make up battery section 2. This section is located behind section 1 and contains battery cell groups 45 through 72. The transverse battery section is section number 3 and it contains the remaining 44 battery cell groups 1 through 44. The battery sections also contain two temperature sensors, with one sensor located at each end of the section.

The battery energy control module monitors the voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A voltage sense harness joins this connector to the battery energy control module.

The battery energy control module contains internal interface control modules that monitor specific cell groups.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for diagnostic trouble code information.

Conditions for Running the DTC

P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P3038, P3039, P3043, and P3044

- The hybrid/EV battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- None of the hybrid/EV battery energy control module loss of communication with hybrid/EV battery interface control module 1 - 12 DTCs are set.
- None of the hybrid/EV battery interface control module 1 - 12 performance DTCs are set.

P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P303A, and P3045

- The hybrid/EV battery energy control module and hybrid/EV powertrain control module 2 are awake and communicating.
- None of the hybrid/EV battery energy control module loss of communication with hybrid/EV battery interface control module 1 - 12 DTCs are set.
- None of the hybrid/EV battery interface control module 1 - 12 performance DTCs are set.
- None of the hybrid/EV battery 1 - 96 circuit low voltage DTCs are set.
- None of the hybrid/EV battery 1 - 96 circuit high voltage DTCs are set.
- None of the hybrid/EV battery 1 - 96 circuit DTCs are set.

Conditions for Setting the DTC

P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P3038, and P3043

A hybrid/EV battery interface control module has detected the voltage sum of 8 cell groups in a section are less than 1.5 V.

P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P3039, and P3044

A hybrid/EV battery interface control module has detected the voltage sum of 8 cell groups in a section are greater than 48.5 V.

P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P303A, and P3045

A hybrid/EV battery interface control module has detected a deviation between the module voltage sum of a half section minus the voltage sum of 8 individual cell groups in a section is greater than 0.6 V

Actions Taken When the DTC Sets

- DTCs P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P3038, P3039, P303A, P3043, P3044, and P3045 are Type A DTCs.
- The vehicle will operate in a reduced power mode and the extended range mode.
- Once the vehicle has been turned OFF, the hybrid/EV powertrain control module 2 will not CLOSE the high voltage contactors until the DTC has been cleared.

Conditions for Clearing the DTC

DTCs P1FD5, P1FD6, P1FD7, P1FD8, P1FD9, P1FDA, P1FDB, P1FDC, P1FDD, P1FDE, P1FDF, P1FE0, P1FE1, P1FE2, P1FE3, P1FE4, P1FE5, P1FE6, P1FE7, P1FE8, P1FE9, P1FEA, P1FEB, P1FEC, P1FED, P1FEE, P1FEF, P1FF0, P1FF1, P1FF2, P3038, P3039, P303A, P3043, P3044, and P3045 are Type A DTCs.

Circuit/System Verification

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Verify that DTC P1FD5-P1FF2, P3038, P3039, P303A, or P3043-P3045 is not set.

- If DTC P1FD5-P1FF2, P3038, P3039, P303A, or P3043-P3045 is set

1. Vehicle OFF, disable high voltage. Refer to [High Voltage Disabling](#).
2. Replace the K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to [Battery Energy Control Module Replacement](#).

- If none of the DTCs are set

2. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for K16 battery energy control module replacement, programming and setup.

DTC P1F17: SYSTEM ISOLATION/IMPACT SENSOR FAULT - HYBRID/EV BATTERY SYSTEM CONTACTORS OPEN

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1F17

System Isolation/Impact Sensor Fault - Hybrid/EV Battery System Contactors Open

Circuit/System Description

The hybrid/EV powertrain control module 2 will set DTC P1F17 if the hybrid/EV powertrain control module 1 has detected a passive loss of isolation in combination with the supplemental inflatable restraint sensors are not working or has lost communications with the hybrid/EV powertrain control module 1 and the supplemental inflatable restraint module.

Conditions for Running the DTC

Vehicle ON.

Conditions for Setting the DTC

- DTC P1AF0, P1AF2 or P1E22 is set in the hybrid/EV powertrain control module 1.

AND

- DTCs B0083-B0088 are set in the supplemental inflatable restraint module.

OR

- DTC P1AF0, P1AF2 or P1E22 is set in the hybrid/EV powertrain control module 1.

AND

- DTC U184E is set.

OR

- The hybrid/EV powertrain control module 2 has lost communications with the hybrid/EV powertrain control module 1 and the supplemental inflatable restraint module.

AND

- DTC U184E is set.

OR

- The hybrid/EV powertrain control module 2 has lost communications with the hybrid/EV powertrain control module 1.

AND

- DTCs B0083-B0088 are set in the supplemental inflatable restraint module.

Action Taken When the DTC Sets

- DTC P1F17 is a type A DTC.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

- DTC P1F17 is a type A DTC.
- The **Clear Secured High Voltage DTCs** reset function must be performed with a scan tool before clear codes.

LOSS OF ISOLATION ON THE HIGH VOLTAGE MAIN BUS

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Circuit/System Description

Vehicles equipped with high voltage energy storage are designed with the high voltage circuits isolated from the vehicle chassis. If either the positive or negative high voltage Direct Current (DC) circuits or any of the high voltage Alternating Current (AC) phase circuits lose this isolation to the vehicle chassis, one or more diagnostic trouble codes (DTCs) may set.

The vehicle utilizes Passive and Active isolation testing to determine the amount of isolation between the high voltage and the chassis.

Passive isolation testing is performed within the power inverter module and tests whenever the high voltage main contactors are closed. Utilizing a high impedance resistor network, passive isolation detection monitors all high

voltage components including the hybrid/EV battery pack and isolation loss results in DTCs P1AF0, P1AF2 and/or P1E22. Real-time status of passive isolation detection can be determined by observing the delta between the Positive Supply Isolation Voltage and Negative Supply Isolation Voltage scan tool parameters. The parameters are displayed by any of the Motor Control Modules.

Active isolation testing is performed by the hybrid powertrain control module 2 and tests after the high voltage main contactors open. Utilizing a switched resistance, active isolation detection monitors the internal Hybrid/EV battery pack as well as the charging system direct current (DC) high voltage circuits and isolation loss results in DTC P0AA6. Status for the prior active isolation detection event can be determined by observing the hybrid powertrain control module 2 Isolation Test Resistance scan tool parameter. Real-time status observation requires the HPCM2 scan tool control function Hybrid/EV Battery Pack Isolation Test.

Diagnosis for isolation requires testing with high voltage potential. Special insulation testing multimeters such as the EL-50772 utilize their own internal high voltage and must be used to test the isolation capability of high voltage components and circuits. Refer to [Troubleshooting With an Insulation Multimeter](#).

Diagnostic Aids

Prior to disabling high voltage:

Monitoring certain scan tool parameters when high voltage is active may help to identify which high voltage components and circuits have lost their chassis isolation. The Vehicle Information selection within the HPCM2 scan tool Data Display contains many parameters related to isolation diagnosis. The Drive Motor 1 Control Module Positive Supply Isolation Voltage and Drive Motor 1 Control Module Negative Supply Isolation Voltage parameters provide a real-time indication of isolation status. The parameters will shift in respect to one another relative to the level of isolation loss. The greater the delta, or difference, between parameters, the less isolation exists between high voltage and the vehicle chassis.

Isolation Loss between HV Components and Chassis, Positive Side*

Isolation between HV Bus and Chassis	Normal Vehicle	10M	5M	1M	500K	200K Approximate Passive Isolation DTC set point	100K	None - Direct Short
Positive Isolation Parameter*	198V	180V	165V	110V	75V	35V	20V	0V
Negative Isolation Parameter*	192V	210V	225V	280V	315V	355V	370V	390V
Delta Between Parameters	0 - 15V	30V	60V	170V	240V	320V	350V	390V
*Typical values observed with a fully charged pack, 390V. A short to the positive bus is shown, a short to the negative bus would display inverted voltages of similar value.								

Certain isolation loss concerns may only appear during high moisture environmental conditions. Drive the vehicle thru an underbody spraying-style car wash while monitoring the delta between Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters.

Isolation loss might only occur when a high voltage device is active. Use the High Voltage Component Test Method table and operate each HV component while monitoring the delta between Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters.

M15A, M15B Drive Motors	N/A - Always Active with High Voltage Enabled	Insulation Multimeter
G5 Transmission Fluid Pump	N/A - Always Active with High Voltage Enabled	Insulation Multimeter
A4 Battery Pack - Internal Side of Contactors	Isolation Concern Results in DTC P0AA6	
*Because the E54 Battery Heater is always connected to the positive bus, an isolation fault may result in a delta decrease when commanded ON.		

After disabling high voltage:

High Voltage cables disconnected at each end from their respective modules must be tested with the insulation meter connected to their shield circuit and not to vehicle chassis.

The **EL-50772** insulation meter, when set to the 500V scale, indicates 550M Ω when measuring infinite or open circuit conditions. An equivalent meter may display 'infinite' value in a different manner.

For equivalent regional tools, refer to Special Tools.

Circuit/System Verification

1. Remove all vehicle chargers.
2. Vehicle ON.
3. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE3, P0AE4, P0D09, P0D0A, P1EBD, P1EC0, or P1EC3 is not set.
 - **If any DTC is set**
 Refer to **DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE3, P0AE4, P0D09, P0D0A, P1EBD, P1EC0, or P1EC3.**
 - **If none of the DTCs are set**
4. Verify that DTC P0AA6 or P1AE6 is not set.
 - **If any DTC is set**
 Refer to **DTC P0AA6 or P1AE6.**
 - **If none of the DTCs are set**

NOTE: High voltage must be enabled to obtain accurate results.

5. Vehicle ON, observe the scan tool Drive Motor 1 Positive Supply Isolation Voltage and the Drive Motor 1 Negative Supply Isolation Voltage scan tool parameters.
6. Is the delta, or difference, between the Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters greater than 15 volts?
 - **If the delta is greater than 15 volts**
 Using the High Voltage Component Test Methods table as a guide, observe and record which components are active. Refer to Circuit/System Testing.
 - **If the delta is 15 volts or less**
7. Using the High Voltage Component Test Method table as a guide, turn ON devices one at a time while monitoring the isolation voltage delta.

8. Is the delta between the Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters greater than 15 volts when a component is active?

- **If the delta is greater than 15 volts**

Observe and record which components are active. Refer to Circuit/System Testing.

- **If the delta is 15 volts or less**

9. Turn the vehicle OFF, open and close the drivers door and wait two minutes.

10. PRESS and HOLD the brake pedal and activate the HPCM2 scan tool control function Hybrid/EV Battery Pack Isolation Test. The battery pack isolation test will complete in less than a minute. Verify the Isolation Test Resistance parameter when the test is complete is greater than 350K ohms.

- **If the resistance is 350K or less**

Refer to **DTC P0AA6 or P1AE6**.

- **If the resistance is greater than 350K ohms**

11. Vehicle OFF. Connect the vehicle charge cord. Ensure charge mode is active.

12. With charge mode already active, Vehicle ON and observe the scan tool Drive Motor 1 Positive Supply Isolation Voltage and the Drive Motor 1 Negative Supply Isolation Voltage scan tool parameters.

13. Is the delta between the Positive Supply Isolation Voltage and the Negative Supply Isolation Voltage scan tool parameters greater than 15 volts?

- **If the delta is greater than 15 volts**

Refer to Circuit/System Testing.

- **If the delta is less than 15 volts**

14. All OK, review Diagnostic Aids.

Circuit/System Testing

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

NOTE: **Wear your High Voltage Insulation gloves until you have determined that a high voltage exposure risk is no longer present.**

1. Disable the high voltage for servicing at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#).
2. Disconnect the A4 Hybrid/EV Battery pack high voltage harness connector at the T6 Power Inverter Module if not already disconnected during the High Voltage Disabling procedure.
3. Disconnect the G1 Air Conditioning Compressor high voltage harness connector located above the transmission if not already disconnected during the High Voltage Disabling procedure.
4. Disconnect all HV connectors at the A4 Hybrid/EV Battery Pack if not already disconnected during the High Voltage Disabling procedure.

NOTE: **Only perform the following continuity tests using the EL-50772 Insulation Multimeter or equivalent.**

5. Ensure only the **EL-50772** Insulation Multimeter or equivalent is used with this procedure. Select the Isolation Test setting, then select the 500V range. Refer to [Troubleshooting With an Insulation Multimeter](#) for important usage instructions.
6. Test for 550M Ω between the circuit terminals listed below and cable shield, using the **EL-50772** Insulation Multimeter :
 - T18 Battery Charger/K1 14V Power Module harness connector terminal A +300V, at the A4 Hybrid/EV Battery Pack.
 - T18 Battery Charger/K1 14V Power Module harness connector terminal B -300V, at the A4 Hybrid/EV Battery Pack.
 - **If less than 550M Ω**
 1. Disconnect the high voltage harness connector at the K1 14V Power Module.
 2. Test for 550M Ω between the circuit terminals listed below and chassis ground:
 - K1 14V Power Module connector terminal A +300V
 - K1 14V Power Module connector terminal B -300V
 - If less than 550M Ω , replace the K1 14V Power Module.
 - If 550M Ω
 3. Disconnect the high voltage direct current (DC) harness connector at the T18 Battery Charger.
 - 4. Test for 550M Ω between the circuit terminals listed below and chassis ground:
 - T18 Battery Charger module connector terminal A +300V
 - T18 Battery Charger module connector terminal B -300V
 - If less than 550M Ω , replace the T18 Battery Charger.
 - If 550M Ω , replace the 300V DC cable assembly.
 - **If 550M Ω**
7. Test for 550M Ω between the circuit terminals listed below and chassis ground:
 - K10 Heater module harness connector Terminal A +300V at the A4 Hybrid/EV Battery Pack
 - K10 Heater module harness connector Terminal B -300V at the A4 Hybrid/EV Battery Pack
 - **If less than 550M Ω**
 1. Disconnect the high voltage connector at the K10 Heater module.
 2. Retest for 550M Ω between the circuit terminals listed below and chassis ground:

- K10 Heater module harness connector Terminal A +300V at the A4 Hybrid/EV Battery Pack
- K10 Heater module harness connector Terminal B -300V at the A4 Hybrid/EV Battery Pack
- If 550M Ω , replace the K10 Heater module.
- If less than 550M Ω , replace the 300V DC cable assembly.

- **If 550M Ω**

8. Test for 550M Ω between the circuit terminals listed below and chassis ground:

- G1 A/C Compressor module harness connector Terminal A +300V at the A4 Hybrid/EV Battery Pack
- G1 A/C Compressor module harness connector Terminal B -300V at the A4 Hybrid/EV Battery Pack
- If less than 550M Ω , replace the 300V DC cable assembly.

- **If 550M Ω**

9. Test for 550M Ω between the circuit terminals listed below and chassis ground:

- T6 Power Inverter Module harness connector Terminal A +300V at the A4 Hybrid/EV Battery Pack
- T6 Power Inverter Module harness connector Terminal B -300V at the A4 Hybrid/EV Battery Pack
- If less than 550M Ω , replace the 300V DC cable assembly.

- **If 550M Ω**

NOTE: There may be up to a 5 second delay for proper test results to be displayed, always Press and Hold the EL-50772 test button until maximum measurement values are observed.

10. Test for 550M Ω between the circuit terminals listed below and chassis ground:

- G1 A/C Compressor module harness connector Terminal A +300V, located above the transmission
- G1 A/C Compressor module harness connector Terminal B -300V, located above the transmission
- **If less than 550M Ω**

1. Disconnect the high voltage connector at the G1 A/C Compressor module.

2. Retest for 550M Ω between the circuit terminals listed below and chassis ground:

- G1 A/C Compressor module harness connector Terminal A +300V, located above the transmission
- G1 A/C Compressor module harness connector Terminal B -300V, located above the transmission
- If 550M Ω , replace the G1 A/C Compressor module.
- If less than 550M Ω , replace the 300V DC cable assembly.

- **If 550M Ω**

NOTE: Testing of the drive motors and transmission fluid pump motor cannot be performed while connected to the T6 Power Inverter Module.

11. Remove the T6 Power Inverter Module from the transmission. Refer to [Drive Motor Power Inverter Module Removal](#).

NOTE: There may be up to a 5 second delay for proper test results to be displayed, always Press and Hold the EL-50772 test button until maximum measurement values are observed.

12. Test for 550M Ω between each M15B Drive Motor 2, 3 phase buss bar terminal and the transmission case:

- Terminal U 300V
- Terminal V 300V
- Terminal W 300V

- **If less than 550M Ω**

Replace the M15B Drive Motor 2 and the 3 phase connector assembly.

- **If 550M Ω**

13. Test for 550M Ω between each M15A Drive Motor 1, 3 phase buss bar terminal and the transmission case:

- Terminal U 300V
- Terminal V 300V
- Terminal W 300V

- **If less than 550M Ω**

Replace the M15A Drive Motor 1 and the 3 phase connector assembly.

- **If 550M Ω**

14. Test for 550M Ω between the G5 Transmission Fluid Pump 3 phase cable harness circuit terminals listed below and chassis ground:

- Terminal 1 300V
- Terminal 2 300V
- Terminal 3 300V

- **If less than 550M Ω**

Replace the G5 Transmission Fluid Pump.

- **If 550M Ω**

15. Test for 1.1M Ω or greater between each T6 Power Inverter Module high voltage circuit terminal and the chassis of the power inverter module.

- **If less than 1.1M Ω**

Replace the T6 Power Inverter Module.

- **If 1.1M Ω or greater**

16. All OK, review Diagnostic Aids.

Component Testing

1. Perform component testing only after high voltage is disabled.
2. Testing of the Battery Heater must be performed after the A28 Hybrid/EV Battery Contactor Assembly is removed from the Hybrid/EV Battery Pack assembly.
3. Testing of the drive motors and transmission fluid pump must be performed disconnected from the power inverter module.
4. Test with the **EL-50772** insulation multimeter or equivalent, set only at 500V.

HV Component	Component Setup	Insulation Multimeter Test Point	EL-50772 Expected Results
G1 Electric A/C Compressor	None	1. HV Pos+ terminal to compressor housing/HV Neg- terminal to compressor housing 2. Test continuously for several seconds until	550M Ω

HV Component	Component Setup	Insulation Multimeter Test Point	EL-50772 Expected Results
		maximum measurement is obtained.	
K10 Coolant Heater	Plug one coolant port and fill with coolant	HV Pos+ terminal to cable shield/HV Neg- terminal to cable shield	550M Ω
E54 Battery Heater	1. Remove from Hybrid/EV Battery Pack. 2. Plug one coolant port and fill with coolant.	HV Pos+ terminal to heater housing/HV Neg- terminal to heater housing	550M Ω
T18 Battery Charger	None	HV DC Pos+ terminal to module housing/HV DC Neg- terminal to module housing	550M Ω
K1 14V Power Module	None	HV Pos+ terminal to module housing/HV Neg- terminal to module housing	550M Ω
T6 Power Inverter Module	Must be removed from transmission	1. Each HV terminal, both AC and DC, to module housing. 2. Test continuously for several seconds until maximum measurement is obtained.	1.1 to 1.2M Ω
M15A, M15B Drive Motors	Must be electrically disconnected from T6 Power Inverter Module during test	1. Any HV 3 phase terminal to stator ground. 2. Test continuously for several seconds until maximum measurement is obtained.	550M Ω
G5 Transmission Fluid Pump	Disconnect cable from T6 Power Inverter Module	1. Any HV 3 phase terminal to stator ground. 2. Test continuously for several seconds until maximum measurement is obtained.	550M Ω
300-V Battery Positive and Negative Cables	Disconnect cables at both ends	HV Pos+ terminal to cable shield/HV Neg- terminal to cable shield	550M Ω

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Power Inverter Module and A/C Compressor](#)
- Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Heater Coolant Heater](#)
- Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Charger Receptacle, Accessory DC Power Control Module, and Drive Motor Battery Charger](#)
- Refer to [Air Conditioning and Drive Motor Battery Cooling Compressor Replacement](#)
- Refer to [Heater Coolant Heater Replacement](#)
- Refer to [Accessory DC Power Control Module Replacement](#)
- Refer to [Drive Motor Disassemble - 1st Position](#)
- Refer to [Drive Motor Disassemble - 2nd Position](#)
- Refer to [Automatic Transmission Fluid Pump and Fluid Filter Removal](#)
- Refer to [High Voltage Battery Heater Replacement](#)
- Refer to [Control Module References](#) for the T6 power inverter module replacement, programming and setup.

HYBRID/EV BATTERY VOLTAGE PRESENT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors and 1 transistor. The high voltage contactors and transistor allow the high voltage DC batteries to be connected to the vehicle or safely contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and precharge negative high voltage contactor. The transistor controls the battery heater. The contactors and transistor close and open in a specific sequence controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for each high voltage contactor/transistor. Ground is provided through a vehicle ground external of the high voltage battery.

[Circuit/System Testing](#)

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Review the high voltage safety information prior to performing the High Voltage Disabling procedure. Refer to [High Voltage Safety](#)
2. Verify the High Voltage Disabling procedure has been performed and the S15 manual service disconnect has been removed.

- **The procedure has not been performed**

Refer to [High Voltage Disabling](#) before continuing to the next step.

- **The procedure has been performed**

Fig. 44: A4 Hybrid/EV Battery Pack Connector Identification

Courtesy of GENERAL MOTORS COMPANY

NOTE: Connecting the 12 V battery while leaving the S15 manual service disconnect out will set DTCs. Clear these DTCs after all repairs are complete.

3. Disconnect the low voltage (X357) and (X358) harness connectors at the A4 Hybrid/EV Battery Pack. Connect the 12 V battery. Vehicle in Service Mode.
4. Test for less than 9.5 V at the following points and ground:
 - X357, Terminal 2
 - X357, Terminal 4
 - X357, Terminal 6
 - X357, Terminal 7
 - **If 9.5 V or greater**
 1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.
 - **If less than 9.5 V**
5. Vehicle OFF.

NOTE:

- **Wear your High Voltage Insulation gloves until you have determined that a high voltage exposure risk is no longer present.**

- **A 9 V battery or the vehicles 12 V battery can be used to test the DMM.**

6. Test the DMM by measuring a known good 9 to 12 V battery.

- **If the DMM does not properly measure the test battery**

Repair or replace the DMM and repeat all voltage measurements.

- **If the DMM does properly measure the test battery**

7. Replace the A4 Hybrid/EV Battery Pack. There is a stuck closed contactor and a loss of isolation within the A4 Hybrid/EV Battery Pack.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

TROUBLESHOOTING WITH AN INSULATION MULTIMETER

Special Tools

EL-50772 Insulation Multimeter

For regional equivalent tools, refer to [Special Tools](#)

Diagnosis for isolation loss requires insulation testing with high voltage potential. Special multimeters that utilize their own built-in high voltage, such as the **EL-50772** Insulation Multimeter, test the isolation capability of high voltage components and circuits. Understanding an insulation multimeter and how it functions is necessary to obtain proper test results.

How to Use the Insulation Multimeter

1. Read all instructions and warnings that came with your insulation multimeter.

Fig. 45: Ports

Courtesy of GENERAL MOTORS COMPANY

2. Plug into the correct ports (1, 2) for insulation testing. This is easy to get wrong especially if you use the **EL-50772** for standard DMM testing too. Do NOT use ports (3, 4) for insulation testing.
3. Always test at the 500V range.

Fig. 46: Insulation Multimeter (550)

Courtesy of GENERAL MOTORS COMPANY

4. With the test leads not connected to anything, press and hold test button to know how your meter displays an infinite measurement. The **EL-50772** will display 550M Ω when measuring an open circuit while set to the 500V range.

Fig. 47: Insulation Multimeter (0.0)

Courtesy of GENERAL MOTORS COMPANY

5. With the test leads connected together, press and hold test button to know how your meter displays continuity. The **EL-50772** will display 0.0 Ω .

Fig. 48: Insulation Multimeter (0.0)
Courtesy of GENERAL MOTORS COMPANY

6. When performing insulation testing you need a good ground reference. When possible use an alligator clamp to attach the ground lead. Typically, the reference point will be to vehicle chassis except cable testing which requires connection to the cable shield termination at the connector and not to the chassis.
7. Verify your ground connection prior to every test measurement at a suitable ground location near your test point. The **EL-50772** should display 0.0 Ω, indicating continuity.
8. When testing components with large capacitance or inductance, such as certain modules and larger motor stators, it may be necessary to hold the test for a few seconds until the maximum resistance value is displayed.

RECHARGEABLE ENERGY STORAGE SYSTEM SMOKE TEST

Special Tools

- **EL-50812** Volt Battery Smoke Test Leak Adapters
- **EL-51753** Volt Battery Smoke Test Leak Adapters
- **GE 41413-A** Evaporative Emissions System Tester (EEST)

Equivalent regional tools: **Special Tools**

1. Remove Drive Motor Battery. Refer to **Drive Motor Battery Replacement and Shipping Preparation**

Fig. 49: A4 Hybrid/EV Battery Pack Connector Identification
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Adapters for connectors X4, X5 and X6 have to be positioned downward approximately 45 degrees, then pushed upward to lock in place.

2. Install the **EL-51753** Drive Motor Battery smoke test leak adapters to the following Drive Motor Battery Connectors:
 - X3
 - X4
 - X5
3. Install the **EL-50812** Drive Motor Battery smoke test leak adapters to the following Drive Motor Battery Connectors:
 - X357
 - X358
4. Cap or apply duct tape to coolant connector (C1).
5. Reinstall the S15 manual service disconnect lever.

Fig. 50: Gore Patches

Courtesy of GENERAL MOTORS COMPANY

NOTE: Duct tape is not recommended because of damage to the Gore patches when removing.

6. Cover all gore patches (1, 2 and 3) with tape.
7. Create a pencil size hole through the duct tape and vent patch (2) to allow a full soak of the smoke into the Drive Motor Battery.

NOTE: It is not recommended to use the tester in an outside repair bay area because wind and sunlight may affect temperature and your ability to see the smoke.

8. Turn OFF any fans that may cause air movement around or near the Drive Motor Battery.

Fig. 51: Connector

Courtesy of GENERAL MOTORS COMPANY

9. Install the GE 41413-A Evaporative Emissions System Tester (EEST) to connector (1).

NOTE: Completely unwind the smoke hose from the bracket for optimal tester performance.

10. Turn the nitrogen/smoke valve on the control panel to smoke.

NOTE: The remote switch operates in a push ON, push OFF fashion.

11. Press and release the remote switch to activate the tester and inject smoke into the Drive Motor Battery.

Fig. 52: Gore Patches

Courtesy of GENERAL MOTORS COMPANY

12. Soak/Fill the RESS with smoke for FIVE MINUTES until smoke is observed from the hole in vent (2).
13. Once smoke is observed from the hole, press and release the remote switch to deactivate the tester to relieve the pressure within the Drive Motor Battery.
14. Seal the hole in vent (2) with masking tape.

NOTE: For optimal visual smoke performance, deactivate the smoke flow and allow the system pressure to drop. Allowing the smoke to exit through small holes at a low flow rate greatly enhances visibility.

15. Introduce smoke into the Drive Motor Battery for THREE MINUTES. Using a high-intensity white light, look for any visible smoke emitting anywhere from the Drive Motor Battery.
16. Press and release the remote switch to deactivate the tester.
17. Repair any visible leaks by retightening the fasteners or by resealing any areas.
18. Retest the Drive Motor Battery, to ensure repair has been completed.
19. Remove the masking tape from the gore patches (1 and 3).
20. Remove the masking tape from rear vent (2).
21. Open the nitrogen tank valve and turn the nitrogen/smoke valve on the control panel to Nitrogen.
22. Press and release the remote switch to activate the tester and inject nitrogen into the Drive Motor Battery for FIVE MINUTES, verify no smoke is coming from the vent.
23. Remove all old vents from the Drive Motor Battery.
24. Install NEW Gore patches (P/N 20791600), replacing the old vents.
25. Disconnect the tester and remove the adapters from the Drive Motor Battery.
26. Remove the S15 manual service disconnect lever.
27. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#).

REPAIR INSTRUCTIONS

HIGH VOLTAGE SYSTEM INSPECTION

Circuit/System Description

WARNING: Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Until the high voltage system inspection has been completed, store the vehicle with hybrid/EV battery pack installed outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with ULÂ® listed, or equivalent, insulation tape rated at a minimum of 600 V.

Failure to follow these precautions could result in personal injury, death and property damage.

The Inspection Process

The high voltage system and Hybrid/EV battery pack inspection process consists of two levels of inspection:

1. Component Initial Inspection
2. High Voltage Operation Inspection

Results of the inspection processes may result in:

- Hybrid/EV Battery Depower
- Repair, or replacement and recycling of the Hybrid/EV Battery
- Replacement of high voltage components

Vehicle Collision Detection/High Voltage Lockout

The supplemental inflatable restraint system supplements the protection offered by the seat belts. The supplemental inflatable restraint sensing and diagnostic module determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. The hybrid/EV powertrain control module 2 will open the high voltage contactor relays, placing the vehicle in a high voltage lockout state and disabling the vehicle whenever a crash event of sufficient intensity has been detected.

The supplemental inflatable restraint module transmits through serial data to the hybrid/EV powertrain control module 2 both the crash event status and whenever a sensor fault is detected.

NOTE: The Crash Event Detected/Air Bag Deployed high voltage lockout state will remain active until cleared by the Clear Secured High Voltage DTCs procedure.

A complete inspection of the high voltage system must be performed if the vehicle has been involved in a collision.

High Voltage Battery Moisture Exposure

The Lithium Ion hybrid/EV battery pack should be depowered whenever internal components have been exposed to moisture, whether due to vehicle flood, coolant leakage within the hybrid/EV battery pack assembly, etc.

Equivalent regional tools: Special Tools.

Component Initial Inspection

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or

death.

1. Disconnect the 12V battery.
2. Wear personal protection equipment - high voltage gloves, safety glasses or face shield, and remove the S15 Manual Service Disconnect. If vehicle damage does not allow for access to the S15 Manual Service Disconnect, remove the damaged portion of the vehicle until such time as the S15 Manual Service Disconnect can be removed. Refer to [Drive Motor Battery High Voltage Manual Disconnect Lever Replacement](#).
3. Inspect the Hybrid/EV battery pack for evidence of exposure to fire, either directly or in close proximity.

- **If exposure to fire is evident**

1. Depowering of the Hybrid/EV battery pack is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

2. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
3. Continue with inspection.

- **If not exposed to fire**

4. Inspect the Hybrid/EV battery pack enclosure for damage including foreign object intrusion.

- **If damage is evident**

1. Depowering of the Hybrid/EV battery pack and/or damaged module section is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

2. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
3. Continue with inspection.

- **If not damaged**

5. Inspect the vehicle for exposure to water at a level higher than the vehicle rocker panel.

- **If the vehicle was exposed to flood**

1. Remove the battery drain plug, capture and discard any drained fluid.
2. Lift the vehicle rear slightly to assist in fluid extraction.

- **If fluid is present**

1. Depowering of the Hybrid/EV battery pack is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

2. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.

3. Continue with inspection.

- If fluid was not present

Install a new drain plug and continue with inspection.

- **If the vehicle was not flooded**

6. Inspect the battery coolant system for proper level.

- **If battery coolant level is low**

1. Verify if the low coolant is the result of system damage external of the A4 Hybrid/EV battery pack.

- If the cooling system external of the A4 Hybrid/EV Battery Pack is not damaged and/or leaking

1. Remove the battery drain plug, capture and discard any drained fluid.

2. Lift the vehicle rear slightly to assist in fluid extraction.

- If fluid is present

3. Depowering of the Hybrid/EV battery pack is recommended. Maintain post-crash 50 foot vehicle isolation until depowering completion. See Battery Depower after inspection is complete.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

4. After depowering, repair or replace and recycle battery as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.

5. Continue with inspection.

- If fluid is not present

6. Install a new drain plug and continue with inspection.

- If the cooling system external of the A4 Hybrid/EV Battery Pack is damaged and/or leaking

2. Continue with inspection.

- **If the battery coolant system is at the proper level**

NOTE: **Post-crash 50 foot vehicle isolation is no longer required if the Hybrid/EV battery pack did not exhibit damage assessed in the steps above.**

7. Inspect each high voltage component listed below for visible damage. Record the results on the High Voltage Component Inspection Table below.

- G1 Electric A/C Compressor
- K1 14V Power Module
- K10 Coolant Heater
- T6 Power Inverter Module
- T18 Battery Charger
- Transmission case
- X98 Hybrid/EV Battery Charger Receptacle
- All High voltage orange cables
- **If any high voltage component inspection failed and Hybrid/EV battery Depower is recommended**

Disconnect the damaged components from the high voltage bus before attempting in-vehicle depowering of the Hybrid/EV battery pack. In extreme cases depowering may need to occur by connecting directly within the Hybrid/EV battery pack with the cover removed. See Battery Depower below.

- **If any high voltage component inspection failed and Hybrid/EV battery Depower is NOT recommended**
- 1. Perform the [High Voltage Disabling](#) procedure and replace the damaged components before attempting to operate the vehicle
- 2. Once you have confirmed or repaired all high voltage component visual integrity, perform High Voltage Operation Inspection below.
- **If all high voltage component inspection passed**

Perform High Voltage Operation Inspection below.

High Voltage Component Inspection Table

High Voltage Component	Inspection (passed/failed)
G1 Electric A/C Compressor	Â
K1 14V Power Module	Â
K10 Coolant Heater	Â
T6 Power Inverter Module	Â
T18 Battery Charger	Â
Transmission case	Â
X98 Hybrid/EV Battery Charger Receptacle	Â
All High voltage orange cables	Â

High Voltage Operation Inspection

NOTE: The vehicle must have a functioning 12V system and serial data communications to continue.

1. Verify you have successfully passed the Component Initial Inspection.
 - **If the Component Initial Inspection has failed or not been performed**
DO NOT CONTINUE. Restart the Inspection procedure.
 - **If the Component Initial Inspection has passed**
2. Verify the S15 Manual Service Disconnect is installed.
 - **If the S15 Manual Service Disconnect is not installed**
 1. Wear personal protection equipment - high voltage gloves, safety glasses or face shield.
 2. Install the S15 Manual Service Disconnect. Refer to [Drive Motor Battery High Voltage Manual Disconnect Lever Replacement](#).
 3. Proceed to step 3.
 - **If the S15 Manual Service Disconnect is installed**
3. Connect the 12V battery.
4. Vehicle in Service Mode. With a scan tool select the Hybrid/EV powertrain Control Module 2, Hybrid Battery Pack Contactor Open Reasons data list. Verify if either the Crash Event Detected or Air Bag Deployed parameters indicate YES.
 - **If either parameter displays YES**
The high voltage contactors may be prevented from closing. The vehicle will not start. Perform the Clear Secured High Voltage DTCs procedure and proceed to the next step.
 - **If BOTH parameters indicate NO**

5. Vehicle ON. With a scan tool check for the following HV system DTCs: Contactor DTCs P0AA1, P0AA4, P0AD9, P0ADD, P0AE1, P0AE3, P0D0A, P0D09, P1EBD, P1EC0, P1EC3, Isolation DTCs P0AA6, P1AE6, P1AF0, or P1AF2, Precharge DTCs P0C76, P0C78 or P3061.

- **If any DTCs are set**

Repair these DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#).

- **If none of the DTCs are set**

6. Verify collision repairs are necessary.

- **If collision repairs are not necessary**

High Voltage System Inspection passed.

- **If collision repairs are necessary**

7. Verify High Voltage Disabling is necessary prior to carrying out the collision repairs.

- **If High Voltage Disabling is necessary**

Perform the [High Voltage Disabling](#) before carrying out the collision repairs.

- **If High Voltage Disabling is not necessary**

8. High Voltage System Inspection passed.

Battery Depower

WARNING: Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Store the vehicle with hybrid/EV battery pack installed or the hybrid/EV battery pack assembly outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture until the hybrid/EV battery pack has been discharged. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with UL® listed, or equivalent, insulation tape rated at a minimum of 600 V. Contact the GM Technical Assistance Center for discharge instructions prior to storage and shipping of the hybrid/EV battery pack.

Failure to follow these precautions could result in personal injury, death and property damage.

NOTE: Depowering of the battery:

- Will NOT reduce battery voltage to a safe level. The battery will contain high voltage after depower procedure is complete.
- Reduces the state of charge to the lowest level thus reducing the likelihood of a battery fire.
- Requires special tool EL-50332 battery service tool.
- Allows for future recovery of the battery after an internal battery inspection and/or repair is completed.

NOTE: Depowering is not required if TOTAL hybrid/EV battery pack voltage is 285 volts or less as monitored by either:

- hybrid/EV powertrain control module 2 scan tool Hybrid/EV Battery Pack Voltage parameter

OR

- A DMM directly at the battery sections

Depowering can occur with the Hybrid/EV battery pack in or out of the vehicle. You can configure the **EL-50332** high voltage connections to the Hybrid/EV battery pack at any of the following locations:

- High Voltage power inverter module connection under hood with **EL-50332-255 ***
- High Voltage 12V Power Module connection in rear cargo area with **EL-50332-265 ***
- High Voltage connection at Hybrid/EV Battery Pack with **EL-50332-260 ***
- Directly at battery section terminals with **EL-50332-170**

*Also requires connection to the contactor relay control circuits with **EL-50332-115** and **EL-50332-270** and two **J-35616-35** test probes.

In-Vehicle or Hybrid/EV Battery Pack Cover Installed Depower Instructions

NOTE:

- The **EL-50332** will close the Hybrid/EV battery pack contactors. You must verify the vehicles high voltage system integrity prior to enabling high voltage. Disconnect visually damaged high voltage components/cables from the high voltage system before attempting in-vehicle depowering.
- You must be able to connect to the hybrid/EV powertrain control module 2 vehicle harness connectors or the hybrid/EV battery pack low voltage connectors.
- Wear your Personal Protective Equipment for the duration of the battery depower event.

1. Ensure the integrity of the vehicles high voltage system.
2. Connect to the Hybrid/EV battery pack contactor control circuits with one of the two methods below:

Method 1: Connecting at Hybrid/EV Powertrain Control Module 2 Connectors

NOTE:

In this configuration the **EL-50332** will supply 12V+ power to the battery energy control module via the vehicle wiring and under hood fuse relay center. Because the **EL-50332** has limited 12V+ capacity it will be necessary to jumper the circuits such that only the battery energy control module is supplied with 12V+ power.

1. Connect the **EL-50332** to the contactor control circuits at the hybrid/EV powertrain control module 2 connectors with the **EL-50332-270** interface module and **50332-115** harness.
2. Remove the hybrid/EV powertrain control module 2 fuse F10 and the battery energy control module fuse F12 from the underhood electrical center.

Fig. 53: Fuse Load Circuits

Courtesy of GENERAL MOTORS COMPANY

3. Jumper the fuse load circuits together (1, 2) using two **J-35616-35** test probes and a 10A maximum fused jumper.

Method 2: Connecting at Hybrid/EV Battery Pack Connectors

1. Connect the **EL-50332** to the contactor control circuits at the hybrid/EV battery pack low voltage connectors with the **EL-50332-270** interface module and **50332-115** harness.
3. Connect the **EL-50332** to the applicable high voltage connector.
4. Install the manual service disconnect lever.
5. Follow the **EL-50332** on-screen prompts until depower is completed.

NOTE: Post-crash 50 foot vehicle isolation is no longer required upon successful depower completion.

6. Remove the manual service disconnect lever.

NOTE: Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).

7. Repair, replace or recycle the hybrid/EV battery pack as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
8. Replace any damaged components noted in the High Voltage Component Inspection before attempting to operate the vehicle.
9. Perform the High Voltage Operation Inspection before attempting to operate the vehicle.

Hybrid/EV Battery Pack Removed Depower Instructions

1. Connect the **EL-50332-260** harness to the applicable battery section terminals. If depowering all battery sections install the manual service disconnect lever.
2. Follow the **EL-50332** on-screen prompts until depower is completed.

NOTE: **Post-crash 50 foot vehicle isolation is no longer required upon successful depower completion.**

3. Remove the manual service disconnect lever.

NOTE: **Never return a damaged battery pack or section to the Warranty Parts Center (WPC), Electronic Service Center (ESC) or Battery Service Center (BSC).**

4. Repair, replace or recycle the hybrid/EV battery pack as applicable. Vehicle dismantlers should refer to www.recyclemybattery.com.
5. Replace any damaged components noted in the High Voltage Component Inspection before attempting to operate the vehicle.
6. Perform the High Voltage Operation Inspection before attempting to operate the vehicle.

DRIVE MOTOR BATTERY HIGH VOLTAGE MANUAL DISCONNECT LEVER REPLACEMENT

WARNING: **Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.**

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedure exactly as written may result in serious injury or death.

Removal Procedure

1. Remove Front Floor Console Compartment Divider. Refer to [Front Floor Console Compartment Divider Replacement](#)

Fig. 54: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

2. Rotate Drive Motor Battery High Voltage Manual Disconnect Lever (1) Left

Fig. 55: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

3. Lift Drive Motor Battery High Voltage Manual Disconnect Lever (1) Upwards

Fig. 56: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

4. Rotate Drive Motor Battery High Voltage Manual Disconnect Lever (1) Left

Fig. 57: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

5. Remove Drive Motor Battery High Voltage Manual Disconnect Lever (1)

Installation Procedure

Fig. 58: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Battery High Voltage Manual Disconnect Lever (1)

Fig. 59: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

2. Rotate Drive Motor Battery High Voltage Manual Disconnect Lever (1) Right

Fig. 60: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

3. Push Drive Motor Battery High Voltage Manual Disconnect Lever (1) Downwards

Fig. 61: Drive Motor High Voltage Manual Disconnect Lever
Courtesy of GENERAL MOTORS COMPANY

4. Rotate Drive Motor Battery High Voltage Manual Disconnect Lever (1) Right
5. Pull up on the handle to ensure the lever is in the locked position.
6. Install Front Floor Console Compartment Divider. Refer to [Front Floor Console Compartment Divider Replacement](#)

HIGH VOLTAGE BATTERY HIGH VOLTAGE MANUAL DISCONNECT CONNECTOR REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle,

either indoors or outdoors

- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)

Fig. 62: High Voltage Battery Positive Cable And Fastener
Courtesy of GENERAL MOTORS COMPANY

2. Remove High Voltage Battery Positive Cable Fastener (1)
3. Remove High Voltage Battery Positive Cable (2)

Courtesy of GENERAL MOTORS COMPANY

4. Remove High Voltage Battery Positive Cable Fastener (1)
5. Remove High Voltage Battery Positive Cable (2)

Fig. 64: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

6. Disconnect Electrical Connector (1)

Fig. 65: High Voltage Battery High Voltage Manual Disconnect Connector And Retaining Tabs

Courtesy of GENERAL MOTORS COMPANY

7. Disconnect Retaining Tabs (1) (Qty: 2)
8. Remove High Voltage Battery High Voltage Manual Disconnect Connector (2)

Installation Procedure

Fig. 66: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

1. Connect Electrical Connector (1)

Fig. 67: High Voltage Battery High Voltage Manual Disconnect Connector And Retaining Tabs

Courtesy of GENERAL MOTORS COMPANY

2. Install High Voltage Battery High Voltage Manual Disconnect Connector (2)

Fig. 68: High Voltage Battery Positive Cable And Fastener
Courtesy of GENERAL MOTORS COMPANY

3. Install High Voltage Battery Positive Cable (2)

CAUTION: Refer to [Fastener Caution](#) .

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

4. Install and tighten High Voltage Battery Positive Cable Fastener (1) to 9 N.m (80 lb in)

Fig. 69: High Voltage Battery Positive Cable And Fastener
Courtesy of GENERAL MOTORS COMPANY

5. Install High Voltage Battery Positive Cable (2)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

- 6.

7. Install and tighten High Voltage Battery Positive Cable Fastener (1) to 9 N.m (80 lb in)
8. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
9. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#) - Install

HIGH VOLTAGE BATTERY COVER REPLACEMENT

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

Fig. 70: High Voltage Battery High Voltage Manual Disconnect Connector Fasteners And High Voltage

Battery Cover Fasteners

Courtesy of GENERAL MOTORS COMPANY

3. Remove and DISCARD High Voltage Battery High Voltage Manual Disconnect Connector Fasteners (3) (Qty: 4). Remove and DISCARD the fasteners.
4. Remove High Voltage Battery Cover Fasteners (1) (Qty: 9)

Fig. 71: High Voltage Battery Cover Fasteners

Courtesy of GENERAL MOTORS COMPANY

5. Remove High Voltage Battery Cover Fasteners (1) (Qty: 38)

Fig. 72: High Voltage Battery Cover And Drive Motor Battery Wire Junction Block Relay

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use insulated tools when servicing components beneath the drive motor generator cover.

NOTE: Prying cover off with tools can crack the cover.

6. Carefully lift the corner of the high voltage battery cover (1), where it contacts the drive motor battery wire junction block relay (2) and gently lift the front cover up.

Fig. 73: High Voltage Battery Cover
Courtesy of GENERAL MOTORS COMPANY

7. Remove High Voltage Battery Cover (1)

Installation Procedure

1. Perform the Hybrid/EV Battery System verification. Refer to [Hybrid/EV Battery System Verification](#)

Fig. 74: High Voltage Battery Cover
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Inspect the cover for cracks.**

2. Install the high voltage battery cover (1) by aligning the manual service disconnect (MSD) housing with the high voltage cover opening and gently push the front of the cover down against the drive motor battery wire junction block relay.

Fig. 75: High Voltage Battery Cover Fasteners
Courtesy of GENERAL MOTORS COMPANY

3. Loosely install High Voltage Battery Cover Fasteners (1) (Qty: 38)

Fig. 76: High Voltage Battery Cover Fastener
Courtesy of GENERAL MOTORS COMPANY

4. Loosely install High Voltage Battery Cover Fastener (1)

Fig. 77: New Fasteners

Courtesy of GENERAL MOTORS COMPANY

5. Loosely install NEW fasteners. (1)

Fig. 78: High Voltage Battery Cover Fastener Tightening Sequence (1 Of 3)

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to **Fastener Caution** .

6. Tighten High Voltage Battery Cover Fasteners in sequence to 9 N.m (80 lb in)

Fig. 79: High Voltage Battery Cover Fastener Tightening Sequence (2 Of 3)
 Courtesy of GENERAL MOTORS COMPANY

7. Tighten High Voltage Battery Cover Fasteners in sequence to 9 N.m (80 lb in)

Fig. 80: High Voltage Battery Cover Fastener Tightening Sequence (3 Of 3)
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Clean all high voltage cover fasteners (1) and apply a medium strength thread-locker to the threads.

8. Tighten High Voltage Battery Cover Fasteners in sequence to 9 N.m (80 lb in)

Fig. 81: High Voltage Battery High Voltage Manual Disconnect Connector Fastener Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

9. Tighten NEW fasteners in sequence to 9 N.m (80 lb in)
10. Perform a smoke test on the rechargeable energy storage system. Refer to [Rechargeable Energy Storage System Smoke Test](#)
11. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
12. Enable the high voltage system. Refer to [High Voltage Enabling](#)

HIGH VOLTAGE BATTERY TRAY REPLACEMENT

Fig. 82: High Voltage Battery Tray

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove High Voltage Battery Disconnect Relay. Refer to High Voltage Battery Disconnect Relay Replacement 2. Remove High Voltage Section Battery. Refer to High Voltage Section Battery Replacement (Battery Section 1)High Voltage Section Battery Replacement (Battery Section 2)High Voltage Section Battery Replacement (Battery Section 3) 3. Remove Battery Tray Front Brace. Refer to Battery Tray Front Brace Replacement	
1	Battery Tray

HIGH VOLTAGE BATTERY TRAY SPACER REPLACEMENT

BATTERY COVER SEAL REPLACEMENT

Fig. 84: Battery Cover Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: • Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors • Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors	

Callout	Component Name
• Visually and functionally inspect the gloves before use. • Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedure exactly as written may result in serious injury or death. Preliminary Procedures 1. Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement 2. Clean the sealing surface using acetone, toluene or methyl ethyl ketone.	
1	Drive Motor Battery Seal

BATTERY ENERGY CONTROL MODULE REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)

Fig. 85: Battery Energy Control Module Connector Disconnect Sequence (1 Of 2)

Courtesy of GENERAL MOTORS COMPANY

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

2. Disconnect the battery energy control module connectors in the sequence shown above.

Fig. 86: Battery Energy Control Module Connector Disconnect Sequence (2 Of 2)

1. Install Battery Energy Control Module (2)

Fig. 89: Battery Energy Control Module Connector Reconnection Sequence (1 Of 2)
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

2. Connect the battery energy control module connectors in the sequence shown above.

Fig. 90: Battery Energy Control Module Connector Reconnection Sequence (2 Of 2)
 Courtesy of GENERAL MOTORS COMPANY

3. Connect the battery energy control module connectors in the sequence shown above.

4. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
5. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

NOTE: Service replacement module requires programming.

6. Program the battery energy control module. Refer to [Control Module References](#)

HIGH VOLTAGE BATTERY POSITIVE CABLE REPLACEMENT (BATTERY SECTION 1 TO BATTERY SECTION 2)

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)

CAUTION: Refer to Fastener Caution

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

7. Install and tighten High Voltage Battery Positive Cable Fastener (1) to 9 N.m (80 lb in)

Fig. 106: Retainer
 Courtesy of GENERAL MOTORS COMPANY

8. Install Retainer (1)

Fig. 107: Terminal Cover, High Voltage Battery Positive Cable And Fastener
Courtesy of GENERAL MOTORS COMPANY

9. Install High Voltage Battery Positive Cable (1)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

10. Install and tighten High Voltage Battery Positive Cable Fastener (2) to 9 N.m (80 lb in)
11. Close Terminal Cover (3)
12. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
13. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

HIGH VOLTAGE BATTERY POSITIVE CABLE REPLACEMENT (GENERATOR BATTERY DISCONNECTOR RELAY TO BATTERY SECTION 1)

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)

Fig. 108: High Voltage Battery Positive Cable, Fasteners And Terminal Cover
 Courtesy of GENERAL MOTORS COMPANY

2. Remove High Voltage Battery Positive Cable Fastener (1)
3. Remove High Voltage Battery Positive Cable (2)
4. Open Terminal Cover (3)
5. Remove High Voltage Battery Positive Cable Fastener (5)
6. Remove High Voltage Battery Positive Cable (4)

Installation Procedure

Fig. 109: High Voltage Battery Positive Cable, Fasteners And Terminal Cover
 Courtesy of GENERAL MOTORS COMPANY

1. Install High Voltage Battery Positive Cable (2)

CAUTION: Refer to [Fastener Caution](#)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

2. Install and tighten High Voltage Battery Positive Cable Fastener (1) to 9 N.m (80 lb in)
3. Install High Voltage Battery Positive Cable (4)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

4. Install and tighten High Voltage Battery Positive Cable Fastener (5) to 9 N.m (80 lb in)
5. Close Terminal Cover (3)
6. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
7. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

GENERATOR BATTERY CURRENT SENSOR REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
2. Remove High Voltage Battery Disconnect Relay. Refer to [High Voltage Battery Disconnect Relay Replacement](#)

Fig. 110: Terminal Cover, Fastener And Battery Current Sensor Connector
Courtesy of GENERAL MOTORS COMPANY

3. Open Terminal Cover (1)
4. Remove Fastener (2)
5. Disconnect Battery Current Sensor Connector (3)

Fig. 111: Fasteners

Courtesy of GENERAL MOTORS COMPANY

6. Remove Fasteners (1) (Qty: 2)

Fig. 112: Battery Current Sensor

7. Remove Battery Current Sensor (1)

Installation Procedure

Fig. 113: Battery Current Sensor

Courtesy of GENERAL MOTORS COMPANY

1. Install Battery Current Sensor (1)

Fig. 114: Fasteners

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

2. Install and tighten Fasteners (1) (Qty: 2) to 9 N.m (80 lb in)

Fig. 115: Terminal Cover, Fastener And Battery Current Sensor Connector
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

3. Install and tighten Fastener (2) to 9 N.m (80 lb in)
4. Connect Battery Current Sensor Connector (3)
5. Close Terminal Cover (1)
6. Install High Voltage Battery Disconnect Relay. Refer to [High Voltage Battery Disconnect Relay Replacement](#)
7. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
8. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
9. Lower the vehicle.
10. Fill the cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)

GENERATOR BATTERY DISCONNECTOR RELAY REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#) - Remove

2. Drain the cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)

Fig. 116: Terminal Cover, High Voltage Battery Positive Cable And Fastener
Courtesy of GENERAL MOTORS COMPANY

3. Open Terminal Cover (3)

4. Remove High Voltage Battery Positive Cable Fastener (2)

NOTE: Do not use air tools to remove fasteners. Damage to the stud may result.

5. Remove High Voltage Battery Positive Cable (1)

NOTE: Cover exposed terminal with approved high voltage insulated tape.

Fig. 117: High Voltage Battery Positive Cable, Fasteners And Terminal Cover

17. Unclip the hose retainer. (1)
18. Remove High Voltage Battery Cooling Manifold Outlet Hose (2)

NOTE: **Coolant must be drained before removing hoses.**

Fig. 122: High Voltage Battery Cooling Manifold Inlet Hose And Retainer
 Courtesy of GENERAL MOTORS COMPANY

19. Unclip the hose retainer. (1)
20. Remove High Voltage Battery Cooling Manifold Inlet Hose (2)

NOTE: Coolant must be drained before removing hoses.

Fig. 123: High Voltage Battery Disconnect Relay And Battery Tray Front Brace
 Courtesy of GENERAL MOTORS COMPANY

21. Disengage High Voltage Battery Disconnect Relay (2) @ Battery Tray Front Brace (1)
22. Remove High Voltage Battery Disconnect Relay (2)
23. Transfer components as necessary.

Installation Procedure

Fig. 124: High Voltage Battery Disconnect Relay And Battery Tray Front Brace
Courtesy of GENERAL MOTORS COMPANY

1. Engage High Voltage Battery Disconnect Relay (2) @ Battery Tray Front Brace (1)

Fig. 125: High Voltage Battery Cooling Manifold Inlet Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

2. Install High Voltage Battery Cooling Manifold Inlet Hose (2)
3. Install the retainer. (1)

Fig. 126: High Voltage Battery Cooling Manifold Outlet Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

4. Install High Voltage Battery Cooling Manifold Outlet Hose (2)
5. Install the retainer. (1)

Fig. 127: Ground Nut And Ground Cable
Courtesy of GENERAL MOTORS COMPANY

6. Install Ground Cable (2)

CAUTION: Refer to **Fastener Caution**

7. Install and tighten Ground Nut (1) to 9 N.m (80 lb in)

Fig. 128: Ground Nut And Ground Cable
Courtesy of GENERAL MOTORS COMPANY

8. Install Ground Cable (2)
9. Install and tighten Ground Nut (1) to 9 N.m (80 lb in)

Fig. 129: Electrical Connectors And Retainers
Courtesy of GENERAL MOTORS COMPANY

10. Connect Electrical Connectors (1) (Qty: 2)
11. Install Retainers (2) (Qty: 4)

Fig. 130: High Voltage Battery Positive Cable, Fasteners And Terminal Cover
 Courtesy of GENERAL MOTORS COMPANY

12. Install High Voltage Battery Positive Cable (2)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

13. Install and tighten High Voltage Battery Positive Cable Fastener (1) to 9 N.m (80 lb in)

14. Install High Voltage Battery Positive Cable (4)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

15. Install and tighten High Voltage Battery Positive Cable Fastener (5) to 9 N.m (80 lb in)

16. Close Terminal Cover (3)

Fig. 131: Terminal Cover, High Voltage Battery Positive Cable And Fastener
 Courtesy of GENERAL MOTORS COMPANY

17. Install High Voltage Battery Positive Cable (1)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

18. Install and tighten High Voltage Battery Positive Cable Fastener (2) to 9 N.m (80 lb in)
19. Close Terminal Cover (3)
20. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
21. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
22. Fill the cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
23. Perform Hybrid Cooling System Leak Test. Refer to [Hybrid Cooling System Leak Test](#)

CELL BATTERY HIGH VOLTAGE SENSOR REPLACEMENT (THERMISTOR 6)

Fig. 132: Cell Battery High Voltage Sensor (Thermistor 6)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement	
1	Cell Battery High Voltage Sensor Connector
2	Fastener
3	Cell Battery High Voltage Sensor 6
Procedure	
Gently pull up on the tab (2) and rotate 90 Degrees.	

CELL BATTERY HIGH VOLTAGE SENSOR REPLACEMENT (THERMISTOR 4)

Fig. 133: Cell Battery High Voltage Sensor (Thermistor 4)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement	
1	Cell Battery High Voltage Sensor Connector
2	Fastener
3	Cell Battery High Voltage Sensor 4
Procedure	
Gently pull up on the tab (2) and rotate 90 Degrees.	

CELL BATTERY HIGH VOLTAGE SENSOR REPLACEMENT (THERMISTOR 1)

Fig. 134: Cell Battery High Voltage Sensor (Thermistor 1)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement	
1	Cell Battery High Voltage Sensor Connector
2	Fastener
3	Cell Battery High Voltage Sensor 1
Procedure	
Gently pull up on the tab (2) and rotate 90 Degrees.	

CELL BATTERY HIGH VOLTAGE SENSOR REPLACEMENT (THERMISTOR 5)

Fig. 135: Cell Battery High Voltage Sensor (Thermistor 5)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement	
1	Cell Battery High Voltage Sensor Connector
2	Fastener
3	Cell Battery High Voltage Sensor 5
Procedure	
Gently pull up on the tab (2) and rotate 90 Degrees.	

CELL BATTERY HIGH VOLTAGE SENSOR REPLACEMENT (THERMISTOR 3)

Fig. 136: Cell Battery High Voltage Sensor (Thermistor 3)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement	
1	Cell Battery High Voltage Sensor Connector
2	Fastener
3	Cell Battery High Voltage Sensor 3
Procedure	
Gently pull up on the tab (2) and rotate 90 Degrees.	

CELL BATTERY HIGH VOLTAGE SENSOR REPLACEMENT (THERMISTOR 2)

Fig. 137: Cell Battery High Voltage Sensor (Thermistor 2)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
Remove High Voltage Battery Cover. Refer to High Voltage Battery Cover Replacement	
1	Cell Battery High Voltage Sensor Connector
2	Fastener
3	Cell Battery High Voltage Sensor 2
Procedure	
Gently pull up on the tab (2) and rotate 90 Degrees.	

HIGH VOLTAGE SECTION BATTERY REPLACEMENT (BATTERY SECTION 1)

Removal Procedure

Special Tools

- EL-51763 High Voltage Battery Section Covers
- EL-50115 Battery Section Lifting Adapters
- EL-48264 Battery Pack Lifting Adapter

Equivalent regional tools: [Special Tools](#)

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors

- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to reconnecting the battery energy control module connectors.
3. Disconnect and reconnect the battery energy control module connectors ONLY in the sequence provided in Repair Instructions.

2. Disconnect the Battery Energy Control Module Connectors. Refer to [Battery Energy Control Module Replacement](#)
3. Drain the cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)

14. Install High Voltage Battery Positive Cable (2)

NOTE: Critical high voltage fastener. Perform second torque verification check following re-assembly.

15. Install and tighten High Voltage Battery Positive Cable Fastener (1) to 9 N.m (80 lb in)

Fig. 193: Battery Energy Control Module Connector Reconnection Sequence (1 Of 2)
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: The battery energy control modules internal cell balancing circuitry is powered by the cell group voltage sense circuits. In order to prevent an unrecoverable, unbalanced Hybrid/EV battery section or internal control module damage, always take the following actions:

1. Disconnect ALL of the battery energy control module connectors prior to disconnecting any Hybrid/EV battery section connector.
2. Reconnect all the Hybrid/EV battery section connectors prior to

reconnecting the battery energy control module connectors.

3. Disconnect and reconnect the battery energy control module connectors **ONLY** in the sequence provided in Repair Instructions.

16. Connect the connectors in the sequence shown @ Battery Energy Control Module

Fig. 194: Battery Energy Control Module Connector Reconnection Sequence (2 Of 2)

Courtesy of GENERAL MOTORS COMPANY

17. Connect the connectors in the sequence shown @ Battery Energy Control Module
18. Install High Voltage Battery Positive Cable. Refer to [High Voltage Battery Positive Cable Replacement \(Generator Battery Disconnect Relay to Battery Section 3\)](#)
19. Perform the Hybrid/EV battery cell balancing procedure. Refer to [Hybrid/EV Battery Cell Balancing](#)
20. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
21. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)
22. Fill the cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)

HIGH VOLTAGE BATTERY DISCONNECT RELAY REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)

2. Drain the cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)

BATTERY 300-VOLT POSITIVE AND NEGATIVE CABLE REPLACEMENT - HIGH VOLTAGE BATTERY TO POWER INVERTER MODULE AND A/C COMPRESSOR

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.

- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

BATTERY 300-VOLT POSITIVE AND NEGATIVE CABLE REPLACEMENT - HIGH VOLTAGE BATTERY TO HEATER COOLANT HEATER

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)

2. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

BATTERY 300-VOLT POSITIVE AND NEGATIVE CABLE REPLACEMENT - HIGH VOLTAGE BATTERY TO CHARGER RECEPTACLE, ACCESSORY DC POWER CONTROL MODULE, AND DRIVE MOTOR BATTERY CHARGER

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Rear Compartment Floor Stowage Trim Compartment. Refer to [Rear Compartment Floor Stowage Trim Compartment Replacement](#)
3. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Disable high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
3. Remove Underbody Front Air Deflector-Left Side. Refer to [Underbody Front Air Deflector Replacement - Left Side](#)
4. Remove Underbody Rear Air Deflector. Refer to [Underbody Rear Air Deflector Replacement](#)
5. Remove the drive motor battery radiator surge tank cap. Refer to [Drive Motor Battery Radiator Surge Tank Cap Replacement](#)

Fig. 279: Inspection Plug

Courtesy of GENERAL MOTORS COMPANY

6. Place a drain pan under the vehicle.
7. Remove and DISCARD Inspection Plug (1)

NOTE: Document the color of the fluid and the quantity of fluid drained.

NOTE: If there is any coolant residue present, contact the technical assistant center (TAC).

8. Collect any fluid present in the drain pan and if no fluid is present, insert a clean white cloth or cotton swab through the inspection plug opening, looking for any evidence of coolant residue.

Fig. 280: Ground Straps And Nuts

Courtesy of GENERAL MOTORS COMPANY

9. Remove Ground Strap Nuts (1) (Qty: 4)
10. Remove Ground Straps (2) (Qty: 2)

Fig. 281: Electrical Connectors And Retainers
 Courtesy of GENERAL MOTORS COMPANY

11. Disconnect Electrical Connectors (1) (Qty: 2)
12. Release Retainers (2) (Qty: 2)

NOTE: Cover electrical connectors so contamination of coolant fluid will not happen.

Fig. 282: Drive Motor Battery Coolant Cooler Inlet Hose, Outlet Hose And Retainers
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure all the fluid is drained and use the smoke test plugs so the electrical connectors do not get contaminated with splashed fluid.

13. Place a drain pan under the vehicle.
14. Release Retainer (4)
15. Reposition Drive Motor Battery Coolant Cooler Outlet Hose (3)
16. Release Retainer (1)
17. Reposition Drive Motor Battery Coolant Cooler Inlet Hose (2)

Fig. 283: Cabin Heater Control Module Harness Connector, A/C Compressor Harness Connector And Battery Charger Harness Connector

Courtesy of GENERAL MOTORS COMPANY

NOTE: Wrap exposed electrical connections with electrical tape to keep coolant out of the electrical connections.

18. Disconnect the following:

NOTE: Pull back the red CPA, release the orange tab and pull the connector back approximately 1/4 inch. Depress green tab and disconnect.

- Disconnect K10 Cabin Heater Control Module Harness Connector (1)
- Disconnect G1 Air Conditioning Compressor Harness Connector (2)
- Disconnect T18 Battery Charger Harness Connector (3)

Fig. 284: T6 Power Inverter Module Connector, Cable Retainer And Fastener

Courtesy of GENERAL MOTORS COMPANY

19. Remove Fastener (1)

20. Remove Cable Retainer (2)

NOTE: Release the green CPA, pull on the gray lever and depress the orange tab.

21. Disconnect T6 Power Inverter Module Connector (3)
22. Wrap exposed electrical connections with electrical tape to keep coolant out of electrical connections.

Fig. 285: Rear Body Exhaust Heat Shield
Courtesy of GENERAL MOTORS COMPANY

23. Remove Rear Body Exhaust Heat Shield (2). Refer to [Rear Body Exhaust Heat Shield Replacement](#)

Fig. 286: Drive Motor Battery Support Fixture And Locating Pins
Courtesy of GENERAL MOTORS COMPANY

NOTE: The drive motor battery mass is approximately 204 kg (450 lbs).

24. Mount the **EL 49976** Drive Motor Battery Support Fixture, to a lift table with 4 fasteners.
25. Ensure the long axis of the drive motor battery support fixture (1) is mounted to the long side of the lift table.

NOTE: This must be performed prior to raising the fixture up against the battery tray.

26. Insert the locating pins (2) into the drive motor battery locating holes.

NOTE: The 2 locator pins must not be inserted into the tray/underbody until the alignment is completed.

27. Adjust the angle of the table/lifting fixture until it is parallel to the battery tray/aero shield.

NOTE: There can be no gaps in excess of 5 mm around the perimeter of the lifting fixture. If the gap is in excess of 5 mm, lower the fixture and adjust the alignment.

28. Raise the fixture until it is firmly resting against the tray along the entire perimeter of the fixture.

Fig. 287: Drive Motor Battery Tray Fasteners
Courtesy of GENERAL MOTORS COMPANY

29. Remove Drive Motor Battery Tray Fasteners (1) (Qty: 18)
30. Remove Drive Motor Battery Tray Fasteners (2) (Qty: 4)

NOTE: Ensure all fasteners are removed before lowering the fixture with the drive motor battery.

31. Remove the drive motor battery and the **EL-49976** drive motor battery support fixture from the lift table and set aside.
32. Remove the replacement drive motor battery and the replacement **EL-49976** drive motor battery support fixture from the container and mount to the lift table.
33. Ensure that tape covers the manual disconnect terminals on the drive motor battery.
34. If the drive motor battery is being returned, prepare the drive motor battery for safe shipping by performing the following:

Fig. 288: Coolant Plugs And S15 Manual Service Disconnect (MSD) Cover
Courtesy of GENERAL MOTORS COMPANY

NOTE: As part of the battery removal process, all coolant should be drained from the battery pack.

1. Install coolant plugs (1) in the coolant lines. Coolant plugs can be removed from the new service battery assembly and installed in the returned battery. Additional coolant plugs (GM p/n 22770854) can be ordered if they are needed.

NOTE: The MSD lever should remain with the vehicle and not be returned with the battery assembly.

2. Install the S15 Manual Service Disconnect (MSD) Cover (2). The MSD cover can be removed from the new service battery assembly and installed in the returned battery. Additional MSD covers (GM p/n 22770856) can be ordered if they are needed.

NOTE: The failed battery must be removed and returned with a battery assembly lifting fixture (GM Special Tool EL-49976). This lifting fixture will be attached to the failed battery and placed in the shipping container. Each new service battery will come with a battery assembly lifting fixture for use during installation. You will keep this fixture for servicing future battery removals.

3. Install the High Voltage Connector Cover. The high voltage connector cover can be removed from the service battery and installed on the returned battery. If the service battery assembly did not come with a high voltage connector cover, additional covers can be ordered by calling 1-800 GM TOOLS.

Installation Procedure

1. Mount the lifting table to the EL 49976 drive motor battery support fixture with 4 fasteners.

NOTE: Ensure the long axis of the lifting fixture is mounted and parallel to the long side of the lift table.

2. Install the drive motor battery, with the EL 49976 drive motor battery support fixture to the lift table.

NOTE: Make sure there is no gap around the perimeter more than 5 mm. If there is a gap of 5 mm or greater, realign the EL 49976 drive motor battery support fixture to the drive motor battery.

Fig. 289: Drive Motor Battery Tray Fasteners
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to **Fastener Caution**

3. Install and tighten Drive Motor Battery Tray Fasteners (1) (Qty: 6) to 58 N.m (43 lb ft)
4. Install and tighten Drive Motor Battery Tray Fasteners (2) (Qty: 2) to 22 N.m (16 lb ft)

Fig. 290: Drive Motor Battery Tray Fasteners
Courtesy of GENERAL MOTORS COMPANY

5. Install and tighten Drive Motor Battery Tray Fasteners (1) (Qty: 12) to 58 N.m (43 lb ft)
6. Install and tighten Drive Motor Battery Tray Fasteners (2) (Qty: 2) to 22 N.m (16 lb ft)

NOTE: Ensure all the drive motor generator battery fasteners are installed and torqued prior to lowering the lift table.

Fig. 291: Inspection Plug

Courtesy of GENERAL MOTORS COMPANY

7. Install and tighten the NEW Inspection Plug (1) to 9 N.m (80 lb in)

Fig. 292: Ground Straps And Nuts

15. Install Drive Motor Battery Coolant Cooler Outlet Hose (3)
16. Install Retainer (4)
17. Install Drive Motor Battery Coolant Cooler Inlet Hose (2)
18. Retainer (1)

Fig. 297: Electrical Connectors And Retainers
Courtesy of GENERAL MOTORS COMPANY

19. Connect Electrical Connectors (1) (Qty: 2)
20. Install Retainers (2) (Qty: 2)
21. Fill the drive motor battery with coolant. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)
22. Install Underbody Rear Air Deflector. Refer to [Underbody Rear Air Deflector Replacement](#)
23. Install Underbody Front Air Deflector-Left Side. Refer to [Underbody Front Air Deflector Replacement - Left Side](#)
24. Install Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
25. Install the drive motor battery radiator surge tank cap. Refer to [Drive Motor Battery Radiator Surge Tank Cap Replacement](#)
26. Enable the high voltage system. Refer to [High Voltage Enabling](#)
27. Check the battery pack cooling system for leaks. Refer to [Hybrid Cooling System Leak Test](#)
28. Reprogram the battery energy control module. Refer to [Control Module References](#)
29. Reprogram the HPCM2. Refer to [Control Module References](#)
30. Clear the secured high voltage DTC's. Refer to [Clear Secured High Voltage DTCs](#)
31. If required, perform the battery Hybrid/EV battery pack capacity learn procedure. Refer to [Hybrid/EV Battery Pack Capacity Learn](#)

NOTE: Refer to Diagnostic Aids to determine when, if required procedure should be performed.

AUXILIARY BATTERY WIRING HARNESS REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors

- Visually and functionally inspect the gloves before use.
- Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
2. Remove Battery Energy Control Module. Refer to [Battery Energy Control Module Replacement](#)
3. Remove High Voltage Battery High Voltage Manual Disconnect Connector. Refer to [High Voltage Battery High Voltage Manual Disconnect Connector Replacement](#)

Fig. 298: Electrical Connectors And Retainers

Courtesy of GENERAL MOTORS COMPANY

6. Connect Electrical Connectors (1) (Qty: 6) @ High Voltage Battery Section 1
7. Connect Retainers (2) (Qty: 4)
8. Install Battery Energy Control Module. Refer to [Battery Energy Control Module Replacement](#)
9. Install High Voltage Battery High Voltage Manual Disconnect Connector. Refer to [High Voltage Battery High Voltage Manual Disconnect Connector Replacement](#)
10. Install High Voltage Battery Cover. Refer to [High Voltage Battery Cover Replacement](#)
11. Install Drive Motor Battery. Refer to [Drive Motor Battery Replacement and Shipping Preparation](#)

CLEAR SECURED HIGH VOLTAGE DTCS

Circuit/System Description

The hybrid powertrain control modules 1 and 2 independently monitor for high voltage safety conditions such as airbag deploy events and certain high voltage system faults. When either module identifies one of these conditions, a DTC may set and the vehicle is placed into a 'high voltage lockout' state. While in the lockout state, the high voltage contactor relays are prevented from closing.

The purpose of the high voltage lockout state is to allow for high voltage system inspection prior to re-enabling. A complete inspection of the high voltage system and components must be performed if the vehicle has been involved in a collision. Perform the [High Voltage System Inspection](#) procedure, if necessary, prior to clearing a Secured High Voltage DTCs/lockout state.

Diagnostic Aids

- The following conditions may result in a HV lockout state without a corresponding DTC:
 - High voltage component replacement
 - Low 12 V battery event
 - SPS programming event
 - Airbag deployment/crash event detected: The Inflatable Restraint Sensing and Diagnostic Module may or may not set a DTC but will continue to broadcast a crash event status until reset.
- Performing a scan tool DTC Clear may clear the diagnostic that set the HV lockout state, but will not reset the lockout.
- Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.
- The Clear Secured High Voltage DTCs procedure must be completed when the following components, as applicable, are replaced:
 - K16 Hybrid/EV Battery Energy Control Module
 - K112A - K112H Hybrid/EV Battery Interface Control Module
 - A4 Hybrid/EV Battery Pack
 - K114A Hybrid/EV Powertrain Control Module 1
 - K114B Hybrid/EV Powertrain Control Module 2

Contactor Open Reasons Reset

The hybrid/EV powertrain control module 2, Hybrid/EV Battery Contactor Open Reasons scan tool parameter list identifies all past events that commanded contactors open. The parameters can only be reset by either reprogramming the hybrid/EV powertrain control module 2 or by performing the scan tool Hybrid/EV Battery Contactor Open Reasons Reset function. To aid in possible future intermittent diagnosis, the parameters should be reset to NO once all diagnostic procedures are successfully completed.

Scan Tool Hybrid/EV Battery Contactor Open Reasons Reset Function

NOTE: **The hybrid/EV system must be able to enter a Propulsion Active state.**

1. Complete the Circuit System Verification and Testing as necessary.
2. Remove any chargers and as applicable, the charge cord.
3. Vehicle OFF, wait 5 minutes.

NOTE: **It is not necessary to completely remove the S15 Manual Service Disconnect.**

4. Disengage the S15 Manual Service Disconnect to the first position to open the high voltage interlock loop circuit.
5. Service Mode, enable the scan tool reset function.

6. Vehicle OFF, wait 5 minutes.
7. Fully engage the S15 Manual Service Disconnect.
8. Start the vehicle and Clear Vehicle DTCs.

Reference Information

Special Tools

EL-49642 SPS Programming Support Tool

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

1. Vehicle ON.
2. With a scan tool, verify the Hybrid/EV Powertrain Control Module 2 parameters Hybrid/EV Battery Positive Contactor Command and Hybrid/EV Battery Negative Contactor Command each indicate Closed.
 - **If the contactors are not commanded Closed**

Refer to Circuit/System Testing.
 - **If the contactors are commanded Closed**
3. A Secured High Voltage DTC HV lockout state is not present. All OK.

Circuit/System Testing

The Clear Secured High Voltage DTCs reset process requires scan tool interaction with **two or three different control modules in sequence** and can be completed using the following steps:

1. Install **EL-49642** SPS programming support tool.
2. Vehicle in Service Mode. With a scan tool select the Hybrid/EV Powertrain Control Module 2, Hybrid Battery Pack Contactor Open Reasons data list. Verify if either the Crash Event Detected or Air Bag Deployed parameters indicate YES.
 - **If either parameter displays YES**
 1. Perform the [High Voltage System Inspection](#) procedure.
 2. If the results of the inspection procedure support enabling of the high voltage system, perform the Inflatable Restraint and Sensing Diagnostic Module function Reset High Voltage Disable Request After Crash Event Detected.
 3. Turn the vehicle OFF for 5 minutes.
 4. Proceed to next step.
 - **If BOTH parameters indicate NO**
3. Vehicle in Service Mode. With a scan tool, clear All DTCs.

NOTE: **A command reject may appear on the scan tool after the first Clear Secured High Voltage DTCs request. If this occurs, ignore this command reject and continue to the next step.**

4. With a scan tool, select Hybrid/EV Powertrain Control Module 2 Control Functions list. Select Clear Secured High Voltage DTCs and follow the on-screen instructions waiting 45 seconds before exiting the screen.
5. With a scan tool, select Hybrid/EV Powertrain Control Module Control Functions list. Select Clear Secured High Voltage DTCs. Select Continue button waiting 45 seconds before exiting the screen.

6. With a scan tool, select Hybrid/EV Powertrain Control Module 2 Control Functions list. Select Clear Secured High Voltage DTCs and follow the on-screen instructions.
7. With a scan tool, clear All DTCs.
8. Allow the Hybrid/EV powertrain Control Modules to enter sleep mode by performing the following:
 1. Turn the vehicle OFF.
 2. Ensure the scan tool is not communicating with any control modules by returning to the Home screen.
 3. Ensure the scan tool is accessible without having to open doors or otherwise cause control module wake-up.
 4. Shut all doors. Do NOT depress the brake pedal or activate any vehicle controls such as the parking lights, fuel door release, etc.

NOTE: Sleep mode is usually entered within two minutes after shutting off the vehicle. However, activating vehicle features such as Refuel Mode may extend this time up to 30 minutes.

5. Wait 5 minutes with the vehicle in the prescribed condition so that the modules may enter sleep mode.
9. With a scan tool, verify the Hybrid/EV Powertrain Control Module 2 has gone to sleep by ensuring communication is not present.
 - **If communication is present**

Repeat the previous step.
 - **If communication is not present**
10. Start the vehicle.
11. Verify that no DTCs are set.
 - **If any DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If no DTCs are set**
12. All OK.

HYBRID/EV BATTERY PACK CAPACITY LEARN

Circuit/System Description

The Hybrid Powertrain Control Module 2 learns the battery capacity as the Hybrid/EV battery pack is discharged and charged. Once learned, the capacity value is allowed to change over a long period of time, as the battery ages.

Replacement of the battery pack, all battery sections or the Hybrid Powertrain Control Module 2 requires capacity learning at a faster rate than normal.

To enable hardware replacement, the Hybrid Powertrain Control Module 2 can be placed into a fast learn mode with the scan tool.

Activating the fast Capacity Learn mode will reset the battery capacity to a much lower value and subsequent charge/discharge cycles will then learn the capacity back up to the proper value. Initially this may have a noticeable effect on EV range until the capacity learning for the new hardware begins. It may take several battery pack depletions and charges for a maximum EV range to be learned/displayed.

Diagnostic Aids

The Hybrid/EV Battery Pack Capacity Learn procedure must be completed when the following components are replaced:

- Hybrid Powertrain Control Module 2
- Hybrid/EV Battery Pack
- All battery sections

Whenever the Hybrid/EV Battery Pack Capacity Learn is activated the vehicle needs to be operated in a normal manner in order to learn an accurate battery capacity value.

NEVER disconnect the 12V battery supply to the vehicle or the Hybrid Powertrain Control Module 2 after initially activating the Hybrid/EV Battery Pack Capacity Learn. Loss of 12V power will force the Hybrid Powertrain Control Module 2 to store the current capacity value as accurate and will also disable fast learning. The process needs to complete without 12V battery interruption for the best results. Repeat the Hybrid/EV Battery Pack Capacity Learn any time 12V battery interruption occurs prior to operating the vehicle by driving and/or charging. It is possible to observe whether an update has occurred by looking at the battery capacity after charging and/or driving the vehicle.

Hybrid/EV Battery Pack Capacity Learn

NOTE: Hybrid/EV Battery Pack Capacity Learn should **ONLY** be activated when the battery pack, **ALL** battery sections or the Hybrid Powertrain Control Module 2 has been replaced.

The Hybrid/EV Battery Pack Capacity Learn procedure can be activated with a scan tool using the following steps:

1. Vehicle On
2. With a scan tool, select Hybrid Powertrain Control Module 2 Configuration/Reset Functions. Select the Learn Functions - Hybrid/EV Battery Pack Capacity Learn and command a Learn.
3. Observe and record the alphanumeric value in the Hybrid/EV Battery Pack Capacity scan tool parameter.
4. Connect the vehicle charge cord and completely charge the hybrid/EV battery pack.
5. The vehicle is OK to return to the customer. Inform the customer that their EV range will continue to learn as the vehicle is operated normally. Longer drive trips followed by full charging will allow the fastest learn.
6. If the customer returns with an EV Range concern, contact technical assistance.

HYBRID/EV BATTERY CELL BALANCING

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

Hybrid/EV Battery Cell Balancing

The **EL-50332** Hybrid/EV Battery Service Tool is used to match the voltage level of a replacement battery section to the existing battery sections following a service event. The tool will charge or discharge the replacement section, as required, based on measured cell group voltage data. The EL-50332 requires feedback from the battery energy control module during the balancing process. Communication is through the A4 Hybrid/EV Battery Pack X357 and X358 connectors and a low voltage interface harness provided with the EL-50332 Hybrid/EV Battery Service Tool. The charging and discharging is performed by direct connection to the replacement battery section positive and negative terminals.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Until the high voltage system inspection has been completed, store the vehicle with hybrid/EV battery pack installed outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with UL® listed, or equivalent, insulation tape rated at a minimum of 600 V.

Failure to follow these precautions could result in personal injury, death and property damage.

Inspection Procedure

NOTE: Before balancing a battery section, make sure all of the external EL-50332 components and cables are in good condition and working order.

1. Connect the EL-50332-145 Black Banana Jack Cable, EL-50332-150 Red Banana Jack Cable, and EL-50332-155 Green Banana Jack Cable to the EL-50332-105 Universal Fuse Box.
2. Connect the EL-50332-120 High Voltage Interface Cable to the EL-50332-105 Universal Fuse Box.

3. Connect the **EL-50332-120** High Voltage Interface Cable to the **EL - 50332** Hybrid/EV Battery Service Tool.
4. Connect the **EL-50332-135** Hybrid/EV Battery Contactor Assembly Interface Cable to the **EL-50332-270** Vehicle Interface Module 2.
5. Connect the **EL-50332-125** Vehicle Interface Module Low Voltage 24-Pin Cable to the **EL-50332-270** Vehicle Interface Module 2.
6. Connect the **EL-50332-125** Vehicle Interface Module Low Voltage 24-Pin Cable to the **EL-50332** Hybrid/EV Battery Service Tool.

NOTE: **Refer to the Special Tools for the correct regional power cord.**

7. Connect the appropriate regional power cord to the **EL-50332** Hybrid/EV Battery Service Tool.
8. Connect the appropriate regional power cord into a known good power outlet.
9. Turn ON the **EL - 50332** Hybrid/EV Battery Service Tool using the power switch.
10. At the MAIN MENU, select SECTION BALANCE, press the SELECT soft key.
11. At the TYPE menu, select VOLTEC, press the NEXT soft key.
12. At the TARGET menu, select appropriate section to be balanced, press the NEXT soft key.
13. Connect the **EL-50332-155** Green Banana Jack Cable to the A4 Hybrid/EV Battery Pack ground stud.
14. Connect the **EL-50332-145** Black Banana Jack Cable to the appropriate section negative stud to be balanced. Refer to [Hybrid/EV Energy Storage Schematics](#) for Hybrid Battery Section 1, Hybrid Battery Section 2, or Hybrid Battery Section 3.
15. Connect the **EL-50332-150** Red Banana Jack Cable to the appropriate section positive stud to be balanced. Refer to [Hybrid/EV Energy Storage Schematics](#) for Hybrid Battery Section 1, Hybrid Battery Section 2, or Hybrid Battery Section 3.
16. Press the NEXT soft key.
17. Connect the **EL-50332-135** Hybrid/EV Battery Contactor Assembly Interface Cable to the A4 Hybrid/EV Battery Pack.

NOTE: **Depending on the charge condition of the battery pack and the section being balanced, this process may take up to 4 hours to complete.**

18. Press the NEXT soft key.

NOTE: **The EL-50332 will now balance the selected section by charging/discharging, as appropriate. Target voltage varies based on measured pack cell group voltages. Initial balancing will be in a constant current mode (max 5 amp charge, 7.5 amp discharge). The tool will transition to a constant voltage mode (decreasing current) near the end of the event. A warranty code and pack voltage current data will be displayed at the conclusion of the balancing event.**

19. An audible tone will sound at the end of balancing or in the event of a fault condition.

- **A fault condition was detected**

Refer to the **EL - 50332** Hybrid/EV Battery Service Tool Instruction Manual.

- **Section balancing completed successfully**

20. At the Completed menu, press the NEXT soft key. Record warranty code. Press the EXIT soft key.
21. Disconnect the **EL - 50332** Hybrid/EV Battery Service Tool from the Hybrid/EV Battery Pack.
22. All OK.

HYBRID/EV BATTERY SYSTEM VERIFICATION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

Hybrid/EV Battery System Verification

After major internal A4 Hybrid/EV Battery Pack repairs the technician may use the **EL-50332** Hybrid/EV Battery Service Tool to verify proper cell group voltage and temperature connection/operation prior to installing the battery pack cover and/or installing the battery pack into the vehicle.

The **EL-50332** Hybrid/EV Battery Service Tool communicates with the battery energy control module through the A4 Hybrid/EV Battery Pack low voltage connectors. The tool displays battery cell group voltages for the 96 battery cell groups along with the calculated voltage difference between the highest and lowest readings. The tool also displays the temperatures read by the thermistors located within the battery sections.

Diagnostic Aids

Hybrid/EV Battery System Verification requires that the battery pack is removed from the vehicle and that the battery energy control module contains software. If you are installing a service replacement battery energy control module, connect the battery pack to the vehicle with the **EL-50211** Low Voltage Jumper Harness Extension and program the battery energy control module prior to performing Hybrid/EV Battery System Verification. Perform the [Clear Secured High Voltage DTCs](#) procedure after successfully programming the service replacement battery energy control module.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

WARNING: This vehicle is equipped with a high voltage battery that is completely isolated from the chassis ground. Never utilize AC powered test equipment to probe the high

voltage system. Serious injury, death and component damage could occur if the high voltage system is grounded through the electric utility.

Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Damage to a Lithium Ion hybrid/EV battery pack could result in fire, loss of electrical isolation or exposure to high voltage. Until the high voltage system inspection has been completed, store the vehicle with hybrid/EV battery pack installed outside in a secure area away from buildings and other vehicles and protected from rain, snow and other moisture. Remove the hybrid/EV battery pack high voltage manual disconnect lever and store it in a secure place outside the vehicle. Cover the exposed high voltage opening with UL[®] listed, or equivalent, insulation tape rated at a minimum of 600 V.

Failure to follow these precautions could result in personal injury, death and property damage.

NOTE: Before performing the Hybrid/EV Battery System Verification, make sure all of the external EL-50332 components are in good condition and working order.

1. Connect the **EL-50332-125** to the **EL-50332-270** .
2. Connect the **EL-50332-125** to the **EL-50332** .
3. Connect the appropriate regional power cord to the **EL-50332** .
4. Connect the power cord into a known good power outlet.
5. Turn ON the **EL-50332** using the power switch.
6. At the MAIN MENU, select PACK INFO, press the SELECT soft key.

NOTE: Selecting One-shot will take and display a single snapshot of the battery parameters, selecting Continuous will display live parameter values.

7. At the PACK INFO TYPE menu, select ONE-SHOT, press the NEXT soft key.
8. At the MANUFACTURER menu, select correct BRAND, press the NEXT soft key.
9. At the MODEL menu, select correct MODEL, press the NEXT soft key.
10. At the COMM CONNECTION menu, select HYBRID BATTERY CONTACTOR ASSEMBLY, press the NEXT soft key.
11. Connect the **EL-50332-135** to the A4 Hybrid/EV Battery Pack.
12. Connect the **EL-50332-135** to the **EL-50332-270** , press the NEXT soft key.
13. At the PACK INFO menu, scroll down to the DELTA VCELL parameter. Record and verify the DELTA VCELL is less than 0.1 V.

- **If the DELTA VCELL is 0.1 V or greater**

There is an internal battery pack concern. Inspect for conditions such as improper internal wiring connections or improper cell balancing service procedures.

- **The DELTA VCELL is less than 0.1 V**

14. Record and verify all of the battery temperature sensor readings are within 6[°]C (10.8[°]F) of each other.
- **If any of the battery temperature sensor readings are 6[°]C (10.8[°]F) or greater of each other**

There is an internal battery pack concern. Inspect for conditions such as improper internal wiring

connections or damaged components.

- The battery temperature sensor readings are within 6Â° C (10.8Â° F) of each other

15. All OK.

DESCRIPTION AND OPERATION

DRIVE MOTOR BATTERY SYSTEM DESCRIPTION

Fig. 306: Drive Motor Battery System
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	K1 14V Power Module
2	T6 Power Inverter Module
3	G1 A/C Compressor
4	K10 Cabin Heater
5	T18 Battery Charger

Overview

The high voltage hybrid/EV battery contains 192 individual lithium-ion cells. Two cells are welded together in parallel and called a cell group. There are a total of 96 cell groups in the hybrid/EV battery assembly. These cell groups are electrically connected in series. Each individual cell group is rated at 3.7 V, for a nominal system voltage of 355 V direct current. The battery cell groups are joined to form 3 distinct sections. The first 24 battery cell groups make up battery section 1. This section is adjacent to the cowl and contains battery cell groups 73 through 96. The next 28 battery cell groups make up battery section 2. This section is located behind section 1 and contains battery cell groups 45 through 72. The transverse battery section is section number 3 and it contains the remaining 44 battery cell groups 1 through 44. The battery sections also contain two temperature sensors, with one sensor located at each end of the section for a Hybrid/EV battery pack total of six temperature sensors.

Located within the high voltage Hybrid/EV battery pack, the battery energy control module monitors the temperature, current and voltage of the 96 battery cell groups. The voltage sense lines are attached to each individual cell group, and these sense lines terminate at a connector located on the top surface of the battery section. A voltage sense harness joins this connector to the battery energy control module.

The battery energy control module will determine when a fault condition is present. Diagnostics and system status are communicated from the battery energy control module to the hybrid powertrain control module 2 through serial data. The hybrid powertrain control module 2 is the host controller for battery energy control module diagnostic trouble code information.

Location

The high voltage hybrid/EV battery is located beneath the vehicle. The battery energy control module, current sensor, and high voltage contactors are located within the hybrid battery assembly. The hybrid powertrain control module 2 is located behind the front passenger seat instrument panel.

High Voltage Control

The hybrid/EV battery contains 4 high voltage contactors and 1 solid state relay (transistor). The high voltage contactors and transistor allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors consist of a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor and a precharge negative high voltage contactor. The transistor controls the battery heater high voltage negative circuit.

In order to prevent large in-rush current to capacitors located in the vehicles high voltage components, the contactors close in a specific precharge sequence controlled by the hybrid/EV powertrain control module 2.

Contactor Close Sequence (Precharge)

1. Plug-In Charge Positive Contactor
2. Main Positive Contactor
3. Precharge Negative Contactor

NOTE: **Wait for bus high voltage to attain almost the same level as hybrid/EV battery voltage.**

4. Main Negative Contactor
5. The precharge contactor opens when bus voltage and hybrid/EV battery voltage are equal.

Thermal Management

The hybrid/EV battery is cooled and heated with pre-mixed DEX-COOLÂ®, which is a 50/50 mixture of DEX-COOLÂ® and de-ionized water. A refrigerant/coolant heat exchanger (chiller) and the electric A/C compressor motor control module assembly cools down the high voltage hybrid/EV battery. A high voltage heater inside the hybrid/EV battery can also heat the coolant entering the hybrid/EV battery when needed. Refer to [Hybrid/EV Cooling System Description and Operation](#) .

HYBRID/EV SYSTEM HIGH VOLTAGE ISOLATION DESCRIPTION

Loss of Isolation Description

Vehicles equipped with high voltage storage and propulsion capability are designed with the high voltage circuits isolated from the vehicle chassis. If either the positive or negative high voltage Direct Current (DC) circuits or any of the high voltage Alternating Current (AC) phase circuits lose this isolation to the vehicle chassis, one or more diagnostic trouble codes (DTCs) may set.

Similar to typical 12V vehicle systems, loss of isolation can be as simple as a direct conductor-to-chassis short. Unlike 12V systems however, the potential within high voltage systems means that insulation breakdown is also a cause for loss of isolation. Therefore diagnosis for isolation loss requires testing with high voltage potential. Special multi-meters that utilize their own built-in high voltage, such as the **EL-50772** Insulation Multimeter, are used to test the isolation capability of high voltage components and circuits. Additionally, monitoring certain scan tool parameters when high voltage is active may also help to identify which high voltage components and circuits may have lost their chassis isolation.

Vehicle Loss of Isolation Detection

The vehicle performs two independent tests for isolation:

1. Passive isolation testing which is performed within the power inverter module by the hybrid powertrain control module 1.
2. Active isolation testing which is performed within the Hybrid/EV battery pack by the hybrid powertrain control module 2.

Passive Isolation Testing

Fig. 307: Power Inverter Module Operation Graph
 Courtesy of GENERAL MOTORS COMPANY

The power inverter module continuously performs isolation testing whenever high voltage to the module is present. The power inverter module has one isolation sensing circuit although the drive motor and aux pump control modules monitor and display the sensor data redundantly. The Positive Supply Isolation Voltage and the Negative Supply

Isolation Voltage scan tool parameters give a real-time indication of Isolation status. Under normal operating conditions each of the parameters will indicate about half of the total Hybrid/EV battery pack high voltage potential. When a loss of isolation condition is observed, the Voltage scan tool parameter values will shift in respect to each other. When the voltage shift exceeds a set ratio, DTCs P1AF0, P1AF2, or P1E22 will set.

NOTE: Some high voltage components contain internal switching or inverter circuits that can interrupt a portion of their high voltage circuitry. If such a component, for example the passenger cabin heater, is OFF its complete internal circuitry is not being monitored. Likewise, these internally switched components cannot be fully tested off-vehicle with the EL-50772 Insulation Multimeter, or equivalent.

Scan Tool Parameters

- Drive Motor 1 Positive Supply Isolation Voltage
- Drive Motor 1 Negative Supply Isolation Voltage
- Drive Motor 2 Positive Supply Isolation Voltage
- Drive Motor 2 Negative Supply Isolation Voltage
- Aux Trans Fluid Pump Positive Supply Isolation Voltage
- Aux Trans Fluid Pump Negative Supply Isolation Voltage

The power inverter module isolation sensing circuit communicates one value, which is displayed redundantly by three different modules. The data within the parameters for each module is identical.

Isolation Loss between HV Components and Chassis, Positive Side*

Isolation between HV Bus and Chassis	Normal Vehicle	10M	5M	1M	500K	200K Approximate DTC set	100K	None - Direct Short
Positive Isolation parameter*	198V	180V	165V	110V	75V	35V	20V	0V
Negative Isolation parameter*	192V	210V	225V	280V	315V	355V	370V	390V
Difference Between Parameters	0 - 15V	30V	60V	170V	240V	320V	350V	390V
*Typical values observed with a fully charged pack, 390V. A short to the positive bus is shown, a short to the negative bus would display inverted voltages of similar value.								

Active Isolation Testing

Active isolation testing is dedicated to monitoring the internal Hybrid/EV battery pack HV circuits. The battery energy control module switches fixed resistors between the high voltage system and vehicle chassis. The difference between the switched-to-chassis state and the unswitched state is used to calculate a resistance-to-chassis value. When resistance-to-chassis decreases below a set value, DTC P0AA6 will set.

Active isolation testing occurs when the main high voltage contactor relays are open. For this reason most testing of the Hybrid/EV battery pack occurs just after the vehicle is shut off following a drive trip. The Isolation Test Resistance scan tool parameter indicates the resistance-to-chassis calculation determined when the last Active isolation test was performed.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0480: COOLING FAN RELAY CONTROL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0480

Cooling Fan Relay Control Circuit

Circuit/System Description

The radiator cooling fans are controlled as a pair with a pulse width modulated (PWM) signal on the cooling fan relay control circuit from the hybrid/EV powertrain control module 2. Although the hybrid/EV powertrain control module 2 is directly connected to the cooling fans, the ECM is considered the master controller. The ECM sends a fan command PWM signal to the hybrid/EV powertrain control module 2 through the cooling fan signal hardwire circuit. The hybrid/EV powertrain control module 2 operates in a pass-through mode for any ECM-derived fan request. The higher the duty cycle the higher the cooling fan speed. The right side fan

operates at a maximum speed of 3200 RPM while the left side fan operates at a maximum speed of 2900 RPM.

When the ECM is awake and there are no faults, the hybrid/EV powertrain control module 2 sends its cooling fan requests to the ECM via serial data. The ECM uses this request and other vehicle inputs to decide if and what speed the cooling fans should operate. The ECM sends the cooling fan signal command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the fan relay control signal to the cooling fans to operate and at what speed.

If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate and the ECM is not awake, the hybrid/EV powertrain control module 2 will directly control the cooling fans. If active cooling is needed, the ECM wakes up to operate the air conditioning control module and then the ECM is the master controller for the fans.

Conditions for Running the DTC

The 12 V battery voltage is greater than or equal to 10.2 V.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 has detected an open, short to ground or short to voltage fault on the fan relay control circuit.

Action Taken When the DTC Sets

DTC P0480 is a type B DTC.

Conditions for Clearing the DTC

DTC P0480 is a type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that both the cooling fans are operating at a high speed when commanding the Cooling Fan Motor Command to 90% with a scan tool.
 - **If either or both cooling fans are not operating at a high speed**
Refer to Circuit/System Testing.
 - **If the cooling fans are operating as commanded**
3. Verify that both the cooling fans are operating at a low speed when commanding the Cooling Fan Motor Command to 10% with a scan tool.
 - **If either or both cooling fans are not operating at a low speed**
Refer to Circuit/System Testing.
 - **If the cooling fans are operating as commanded**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate G10 Cooling Fan Motor.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
Repair the open/high resistance in the circuit.
 - **If less than 10 Ω**
3. Connect a test lamp between the B+ circuit terminal 1 and ground.
4. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the G10 Cooling Fan Motor and the fuse.
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 4 and the B+ circuit terminal 1.
6. Vehicle in service mode, verify the test lamp changes between dim (10%) and bright (90%) when

commanding the Cooling Fan Motor Command ON between 10% and 90% with a scan tool.

- **If the test lamp is always dim or does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is always bright**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp changes illumination between bright (90%) and dim (10%)**

7. Replace the G10 cooling fan motor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Engine Coolant Fan Shroud Replacement](#) for G10 cooling fan motor replacement
- [Control Module References](#) for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0A7E: HYBRID/EV BATTERY PACK HIGH TEMPERATURE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0A7E

Hybrid/EV Battery Pack High Temperature

Circuit/System Description

The hybrid/EV battery pack has 6 hybrid/EV battery module temperature sensors. The hybrid/EV powertrain control module 2 uses the battery temperature sensors to determine the hybrid/EV battery module temperature to control the energy storage cooling system operation.

The energy storage system cooling system uses a 12 V hybrid/EV battery pack coolant pump, a refrigerant/coolant heat exchanger (chiller) and the electric A/C compressor motor control module assembly to cool down the high voltage hybrid/EV battery.

Conditions for Running the DTC

- The hybrid/EV powertrain control module 2 and hybrid/EV battery energy control module are awake and communicating.
- None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, or U179C.

Conditions for Setting the DTC

The maximum sensed temperature in the hybrid/EV battery is greater than 73.5°C (164.3°F).

Action Taken When the DTC Sets

- DTC P0A7E is a type A DTC.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

DTC P0A7E is a type A DTC.

Hybrid/EV Battery Temperature Sensor 6 Circuit High Voltage

Circuit/System Description

The hybrid/EV battery temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery cell groups. The hybrid/EV battery interface control module supplies 5 V to the signal circuit and a ground for the low reference circuit. The hybrid/EV battery temperature sensor resistance changes with battery temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The hybrid/EV powertrain control module 2 uses the battery temperature sensors to control the battery cooling system operation.

Conditions for Running the DTC

P0A9D, P0A9E, P0AC7, P0AC8, P0ACC, P0ACD, P0AEA, P0AEB, P0BC4, P0BC5, P0C35, P0C36 and P0C7E

- The 12 V battery voltage is greater than 9 V.

- Hybrid/EV powertrain control module 2 and hybrid/EV battery energy control module are awake and communicating
- None of the following DTCs are set: P1E93, P1E99, P1E9F, P1EA5, P1E8E, P1E94, P1E9A, or P1EA0

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3 and P0C34

None of the following DTCs are set: P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35, P0C36, P1E8E, P1E8F, P1E90, P1E91, P1E93, P1E94, P1E95, P1E96, P1E97, P1E99, P1E9A, P1E9B, P1E9C, P1E9D, P1E9F, P1EA0, P1EA1, P1EA2, P1EA3, P1EA5, P1EB1, P1EB2, P1EB3, P1EB4, P1EB5, U2401, U2603, U2604, U2605, U2606.

Conditions for Setting the DTC

P0A9C, P0AC6, P0ACB, P0AE9, P0BC3 and P0C34

The difference between a hybrid/EV battery temperature sensor and the average of all the other hybrid/EV battery temperature sensors is greater than 20Â°C (36Â°F).

P0A9D, P0AC7, P0ACC, P0AEA, P0BC4 and P0C35

The hybrid/EV battery temperature sensor is greater than 80Â°C (176Â°F).

P0A9E, P0AC8, P0ACD, P0AEB, P0BC5 and P0C36

The hybrid/EV battery temperature sensor is -40Â°C (-40Â°F).

Action Taken When the DTC Sets

- DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35 and P0C36 are type B DTCs.
- If all sensors fail, the vehicle will operate in a reduced power mode and the extended range mode.

Conditions for Clearing the DTC

DTCs P0A9C, P0A9D, P0A9E, P0AC6, P0AC7, P0AC8, P0ACB, P0ACC, P0ACD, P0AE9, P0AEA, P0AEB, P0BC3, P0BC4, P0BC5, P0C34, P0C35 and P0C36 are type B DTCs.

Diagnostic Aids

Low or no coolant or refrigerant in the system may set a DTC P0A9D, P0AC7, P0ACC, P0AEA, P0BC4 or P0C35.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0C47, P1E8C or P1EC6 is not set.

- **If any DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If none of the DTCs are set**

3. Observe the scan tool Hybrid Battery 1 - 6 temperature parameters. The sensor readings should be between -39 and +80°C (-38.2 and + 176°F) with less than a 20°C (36°F) difference between any of the temperature sensor readings. Refer to [Temperature Versus Resistance](#)

- **If not within the specified range**

Refer to Circuit/System Testing.

- **If within the specified range**

4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#) . Remove the A4 Hybrid/EV Battery Pack cover. Refer to [High Voltage Battery Cover Replacement](#)
2. Disconnect the harness connector at the appropriate B32 Hybrid/EV Battery Temperature Sensor.
3. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Disconnect the appropriate harness connector at the K16 Battery Energy Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, replace the Hybrid/EV Battery Pack internal wiring harness.
 - If less than 2 Ω , replace the K16 Battery Energy Control Module.
 - **If less than 10 Ω**

NOTE: With the S15 manual service disconnect removed the 12 V battery connected and the Vehicle in Service Mode, may cause additional DTCs to set. Continue with diagnostics and clear any additional DTCs when repairs are complete.

4. Connect the EL-50211 Low Voltage Jumper Harness Extension. Connect the 12 V battery. Vehicle in Service Mode.
5. Verify with the scan tool the appropriate Hybrid/EV Battery Temperature Sensor is less than -35°C (-38.2°F).
 - **If -35°C (-38.2°F) or greater**
 1. Vehicle OFF, disconnect the appropriate harness connector at the K16 Battery Energy Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, replace the Hybrid/EV Battery Pack internal wiring harness.
 - If infinite resistance, replace the K16 Battery Energy Control Module.
 - **If less than -35°C (-38.2°F)**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2. Verify with the scan tool the appropriate Hybrid/EV Battery Temperature Sensor is greater than 80°C (176°F).
 - **If less than 80°C (176°F)**
 1. Vehicle OFF, disconnect the appropriate harness connector at the K16 Battery Energy Control Module. Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit terminal and ground.
 - If 1 V or greater, replace the Hybrid/EV Battery Pack internal wiring harness.
 - If less than 1 V
3. Vehicle Off.
4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, replace the Hybrid/EV Battery Pack internal wiring harness.
 - If less than 2 Ω , replace the K16 Battery Energy Control Module.
- **If 80 $^{\circ}$ C (176 $^{\circ}$ F) or greater**
7. Test or replace the appropriate B32 Hybrid/EV Battery Temperature Sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate B32 Hybrid/EV Battery Temperature Sensor.
2. Test for 9.9 - 13.4 k Ω at approximately 21.11 $^{\circ}$ C (70 $^{\circ}$ F) between the signal terminal and the low reference terminal. Refer to [Temperature Versus Resistance](#) for Hybrid/EV Battery Temperature Sensor.
 - **If not within the specified range**

Replace the appropriate B32 Hybrid/EV Battery Temperature Sensor.
 - **If within the specified range**
3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Cell Battery High Voltage Sensor Replacement \(Thermistor 6\)](#) [Cell Battery High Voltage Sensor Replacement \(Thermistor 4\)](#) [Cell Battery High Voltage Sensor Replacement \(Thermistor 1\)](#) [Cell Battery High Voltage Sensor Replacement \(Thermistor 5\)](#) [Cell Battery High Voltage Sensor Replacement \(Thermistor 3\)](#) [Cell Battery High Voltage Sensor Replacement \(Thermistor 2\)](#) for B32 Hybrid/EV Battery Temperature Sensor replacement.

DTC P0C43-P0C46: HYBRID/EV BATTERY PACK COOLANT TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0C43

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Performance

DTC P0C44

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit Low Voltage

DTC P0C45

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit High Voltage

DTC P0C46

Hybrid/EV Battery Pack Coolant Temperature Sensor 1 Circuit Erratic

Circuit/System Description

The hybrid/EV battery pack coolant temperature sensor is located in the coolant inlet of the hybrid/EV battery. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV battery coolant. The hybrid/EV battery pack coolant temperature sensor resistance changes with battery coolant temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The battery energy control module uses the hybrid/EV battery temperature sensor to determine the hybrid/EV battery pack temperature to control the battery cooling and heating operations.

Conditions for Running the DTC

P0C43

- Vehicle ON after all high voltage contactor relays had been Open for 4 hours.
- The 12 V battery voltage is greater than 10.2 V.
- None of the following DTCs are set: P0C44, P0C45, P0C46, P0C47, P0A9C, P0A9D, P0A9E, P1E8C, P1E8D, P19FD, P19FE, P19FF, or U0111.

P0C44

- The 12 V battery voltage is greater than 10.2 V.
- Battery energy control module is awake and communicating.
- DTC P1A07 is not set.

P0C45

- The 12 V battery voltage is greater than 10.2 V.
- Battery energy control module is awake and communicating.
- DTC P1A07 is not set.

P0C46

- The 12 V battery voltage is greater than 10.2 V.
- Battery energy control module is awake and communicating.
- None of the following DTCs are set: DTC P0C44, P0C45 or U185A.

Conditions for Setting the DTC

P0C43

The hybrid/EV battery pack coolant temperature sensor reading is not within 22Â°C (40Â°F) of the outside air temperature AND is not within 23Â°C (41Â°F) of the Average Hybrid Battery Pack Temperature.

P0C44

The hybrid/EV battery pack coolant temperature sensor 1 is greater than 87.5°C (189.5°F).

P0C45

The hybrid/EV battery pack coolant temperature sensor 1 is less than or equal to -40°C (-40°F).

P0C46

The hybrid/EV battery pack coolant temperature sensor is intermittent or has changed by 64°C (115°F) or greater within 4 seconds.

Action Taken When the DTC Sets

- DTC P0C43 - P0C46 are type B DTCs.
- The active heating mode is disabled.

Conditions for Clearing the DTC

DTC P0C43 - P0C46 are type B DTCs.

Diagnostic Aids

- Low or no coolant or refrigerant in the system may set a DTC P0C43.
- DTC P0C43 - P0C46 will prevent battery heating and the vehicle will be unable to start in cold weather with battery temperatures below -25°C (-13°F).

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0AC1 or P0B10 is not set.
 - **If any DTC is set**
Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)
 - **If none of the DTCs are set**
3. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor 1 parameter is between -39 and +87.5Â°C (-38.2 and +189.5Â°F).
 - **If not within the specified range**
Refer to Circuit/System Testing.
 - **If within the specified range**
4. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor and Outside Air Temperature Sensor parameters are within 22Â°C (40Â°F) of each other after the vehicle has been OFF and not charging for 4 hours or greater.
 - **If not within the specified range**
Refer to Circuit/System Testing.
 - **If within the specified range**
5. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following

Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#) . Remove the A4 Hybrid/EV Battery Pack cover. Refer to [High Voltage Battery Cover Replacement](#) . Disconnect the harness connector at the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor.

2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K16 Battery Energy Control Module.

- **If less than 10 Ω**

NOTE: With the S15 Manual Service Disconnect removed, the 12 V battery connected, and the Vehicle in Service Mode, may cause additional DTCs to set. Continue with diagnostics and clear any additional DTCs when repairs are complete.

3. Connect the **EL-50211** Low Voltage Jumper Harness Extension. Connect the 12 V battery. Vehicle in Service Mode.

4. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor is less than -35°C (-38.2°F).

- **If greater than -35°C (-38.2°F)**

1. Vehicle OFF, test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K16 Battery Energy Control Module.

- **If less than -35°C (-38.2°F)**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.

6. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor is greater than 87.5°C (189.5°F).

- **If less than 87.5°C (189.5°F)**

1. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
2. Vehicle OFF, test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K16 Battery Energy Control Module.
- **If 87.5 $^{\circ}$ C (189.5 $^{\circ}$ F) or greater**
7. Replace the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor.
2. Test for 2.2 - 3.0K Ω at approximately 21 $^{\circ}$ C (70 $^{\circ}$ F) between the signal terminal and the low reference terminal. Refer to [Temperature Versus Resistance](#) for Hybrid/EV Battery Pack Coolant Temperature Sensor.

- **If not within the specified range**

Replace the B204A Hybrid/EV Battery Pack Coolant Temperature Sensor.

- **If within the specified range**

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Engine Coolant Temperature Sensor Replacement](#) for B204A Hybrid/EV battery pack coolant temperature sensor.
- [Control Module References](#) for battery energy control module replacement, programming and setup.

DTC P0C47, P1E8C, OR P1E8D: HYBRID/EV BATTERY PACK COOLANT PUMP

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0C47

Hybrid/EV Battery Pack Coolant Pump Control Circuit

DTC P1E8C

Hybrid/EV Battery Pack Coolant Pump Enable Circuit Low Voltage

DTC P1E8D

Hybrid/EV Battery Pack Coolant Pump Enable Circuit High Voltage

Circuit/System Description

The hybrid/EV battery pack coolant pump circulates coolant through the hybrid/EV battery refrigerant/coolant heat exchanger and the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV battery pack coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P0C47

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 5 - 95%.

P1E8C

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.

P1E8D

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is disabled.

Conditions for Setting the DTC

P0C47

The hybrid/EV powertrain control module 2 detects the Coolant Pump Control circuit is open, shorted to voltage or shorted to ground.

P1E8C

The hybrid/EV powertrain control module 2 detects the Coolant Pump Enable circuit is shorted to ground.

P1E8D

The hybrid/EV powertrain control module 2 detects the Coolant Pump Enable circuit is open or shorted to voltage.

Action Taken When the DTC Sets

- DTCs P0C47, P1E8C and P1E8D are type B DTCs.
- Hybrid/EV battery pack active heating is disabled.

Conditions for Clearing the DTC

DTCs P0C47, P1E8C and P1E8D are type B DTCs.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is On*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Vehicle On.
2. Verify that DTC P0C43, P0C44, P0C45, P0C46, P1FFB, P1FFC, P1FFD, P1FFE, U0111, U185B, or U2602 is not set.

- **If any DTC is set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV battery pack coolant pump between 20% and 90% with a scan tool.

- Hybrid/EV Battery Pack Coolant Pump Command to be 10% or greater.
- Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
- Hybrid/EV Battery Pack Coolant Pump Speed is greater than 500 RPM.
- **The scan tool parameters listed are not within the specified ranges**

Refer to Circuit/System Testing.

- **The scan tool parameters listed are within the specified ranges**

4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G37 Hybrid/EV Battery Pack Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.

- **If 5 Ω or greater**

Repair the open/high resistance on the ground circuit.

- **If less than 5 Ω**

3. Vehicle On.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.

- **If less than B+**

1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω and the fuse is blown, replace the G37 Hybrid/EV Battery Pack Coolant Pump.

- **If B+**

5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.

6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.

- **If the test lamp is ON**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the pump enable circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K114B hybrid/EV powertrain control module 2.

- **If the test lamp is OFF**

7. Vehicle On. Verify the test lamp illuminates. Command the Hybrid Battery Pack Coolant Pump ON (20 - 90%) with a scan tool if necessary.

- **If the test lamp is OFF**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the pump enable circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the pump enable circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is ON**

8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.

9. Verify that a test lamp changes illumination between bright (20%) and dim (90%) when commanding the Hybrid Battery Pack Coolant Pump ON between 20% and 90% with a scan tool.

- **If the test lamp is always dim or does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is always bright**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **The test lamp changes illumination between bright (20%) and dim (90%)**
10. Remove the test lamp.
 11. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is 0%.
 - **If greater than 0%**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If 0%**
 12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
 13. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is greater than 90%.
 - **If 90% or less**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the feedback circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the feedback circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 90%**
 14. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0CE9

Hybrid/EV Electronics Coolant Pump Control Circuit

DTC P1F44

Hybrid/EV Electronics Coolant Pump Enable Circuit Low Voltage

DTC P1F45

Hybrid/EV Electronics Coolant Pump Enable Circuit High Voltage

Circuit/System Description

The hybrid/EV electronics coolant pump circulates coolant through the power electronics coolant radiator, drive motor generator power inverter module, the battery charger, and the 14 V accessory power module to control the temperature of these modules.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV electronics coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV electronics coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P0CE9

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV electronics coolant pump is enabled.
- The hybrid/EV electronics coolant pump is commanded between 5% and 95%.

P1F44

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV electronics coolant pump is enabled.

P1F45

- The 12 V battery voltage is greater than 10.2 V.
- The Hybrid/EV electronics coolant pump is disabled.

Conditions for Setting the DTC

P0CE9

The Hybrid/EV Powertrain Control Module 2 detects the Coolant Pump Control circuit is open, shorted to voltage or shorted to ground.

P1F44

The Hybrid/EV Powertrain Control Module 2 detects the Coolant Pump Enable circuit is shorted to ground.

P1F45

The Hybrid/EV Powertrain Control Module 2 detects the Coolant Pump Enable circuit is open or shorted to voltage.

Action Taken When the DTC Sets

DTCs P0CE9, P1F44, and P1F45 are a Type B DTCs.

Conditions for Clearing the DTC

DTCs P0CE9, P1F44, and P1F45 are a Type B DTCs.

Diagnostic Aids

- DTC P1F44, and P1F45 may cause DTC P0CE9 to set.
- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37°C (-34°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is On*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If none of the DTCs are set**
3. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV electronics coolant pump between 20% and 90% with a scan tool.
 - Hybrid/EV Electronics Coolant Pump Command to be 10% or greater
 - Hybrid/EV Electronics Coolant Pump Feedback to be 50% +/-5%
 - Hybrid/EV Electronics Coolant Pump Speed is greater than 500 RPM.
 - **The scan tool parameters listed are not within the specified ranges**

Refer to Circuit/System Testing.

- **The scan tool parameters listed are within the specified range**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G35 Hybrid/EV Electronics Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
 - **If 5 Ω or greater**

Repair the open/high resistance on the ground circuit.

- **If less than 5 Ω**
3. Vehicle On.
 4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.

- **If less than B+**

1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω and the fuse is blown

3. Replace the G35 Hybrid/EV Electronics Coolant Pump.

- **If B+**

5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.

6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.

- **If the test lamp is ON**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle On.

2. Test for less than 1 V between the pump enable circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is OFF**

7. Vehicle On. Verify the test lamp illuminates. Command the Hybrid/EV electronics coolant pump ON (20 - 90%) with a scan tool if necessary.

- **If the test lamp is OFF**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the pump enable circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the pump enable circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is ON**

8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.

9. Verify the test lamp changes illumination between bright (20%) and dim (90%) when commanding the hybrid/EV electronics coolant pump ON between 20% and 90% with a scan tool.

- **If the test lamp is always dim or does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp is always bright**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **The test lamp changes illumination between bright (20%) and dim (90%)**
10. Remove the test lamp.
11. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is 0%.
 - **If greater than 0%**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool, Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.
 - **If 90% or less**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the feedback circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the feedback circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 90%**
14. Replace the G35 Hybrid/EV Electronics Coolant Pump.

DTC Descriptor

DTC P0CEF

Hybrid/EV Electronics Coolant Temperature Sensor Performance

DTC P0CF0

Hybrid/EV Electronics Coolant Temperature Sensor Circuit Low Voltage

DTC P0CF1

Hybrid/EV Electronics Coolant Temperature Sensor Circuit High Voltage

DTC P0CF2

Hybrid/EV Electronics Coolant Temperature Sensor Circuit Erratic

Circuit/System Description

The hybrid/EV electronics coolant temperature sensor is located in the combined electronics coolant radiator/air conditioning condenser assembly. The temperature sensor is a variable resistor that measures the temperature of the hybrid/EV electronics coolant. The hybrid/EV electronics coolant temperature sensor resistance changes with coolant temperature. The lower the temperature, the higher the resistance of the sensor. The higher the temperature, the lower the resistance of the sensor. The hybrid/EV powertrain control module 2 uses the hybrid/EV electronics coolant temperature sensor to determine the hybrid/EV electronics temperature to control the hybrid/EV electronics cooling operation.

Conditions for Running the DTC

P0CEF

- The 12 V battery voltage is greater than or equal to 10.2 V.
- Vehicle ON for less than 20 seconds.
- Propulsion system inactive time is greater than 5 hours.
- Hybrid/EV electronics coolant pump off soak time is greater than 1 hour.
- Air Conditioning compressor off soak time is greater than 1 hour.
- On Board Charger module off soak time is greater than 1 hour.
- None of the following DTCs are set; P0071-P0074, P0532, P0533, P0606, P0711-P0713, P0CF0, P0CF1, P0CE9, P0A2B, P0A2C, P0A2D, P1F44, or P1F45.

P0CF0, P0CF1 and P0CF2

- Vehicle ON.
- The 12 V battery voltage is greater than or equal to 10.2 V.

Conditions for Setting the DTC

P0CEF

- The hybrid/EV electronics coolant temperature does not fall within 27Â°C (48.6Â°F) of the outside air temperature.

AND

- The hybrid/EV electronics coolant temperature does not fall within 27Â°C (48.6Â°F) of the transmission fluid temperature.

AND

- The hybrid/EV electronics coolant temperature does not fall within 28Â°C (50Â°F) of the air condition high side pressure, converted to temperature.

P0CF0

The hybrid/EV electronics coolant temperature is greater than 100Â°C (212Â°F) indicating a circuit voltage less than 0.20 V.

P0CF1

The hybrid/EV electronics coolant temperature is less than -40Â°C (-40Â°F) indicating a circuit voltage greater than 4.90 V.

P0CF2

- The hybrid/EV electronics coolant temperature is intermittent or has changed greater than 90Â°C (162Â°F).
- Condition exists for 4 seconds or more.

Actions Taken When the DTC Sets

- P0CEF-P0CF2 are type B DTCs.
- The Hybrid/EV Electronics Coolant Pump is commanded to a fixed speed.

Conditions for Clearing the DTC

P0CEF-P0CF2 are type B DTCs.

Circuit/System Verification

1. Vehicle in Service Mode, verify that DTC P0CE9 is not set.

- **If any DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If none of the DTCs are set**

2. Verify the Hybrid Electronics Coolant Temperature is between -39 and +99°C (-38.2 and +210°F) with a scan tool.

- **If not within the specified range**

Refer to Circuit/System Testing.

- **If within the specified range**

3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B202 Hybrid/EV Electronics Coolant Temperature Sensor.

2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If less than 10 Ω**

3. Vehicle in Service Mode.
4. Verify the scan tool Hybrid Electronics Coolant Temperature is less than -35°C (-38.2°F).
 - **If -35°C (-38.2°F) or greater**
 1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the signal circuit and the circuits listed below:
 - Low reference circuit
 - Chassis ground
 - If less than infinite resistance, repair the appropriate short to ground on the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If less than -35°C (-38.2°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
6. Verify the scan tool Hybrid Electronics Coolant Temperature is greater than 99°C (210°F).
 - **If less than 99°C (210°F)**
 1. Vehicle OFF, remove the jumper wire, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2, Vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Vehicle OFF, test for less than $2\ \Omega$ in the signal circuit end to end.
 - If $2\ \Omega$ or greater, repair the open/high resistance in the circuit.
 - If less than $2\ \Omega$, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If 99°C (210°F) or greater**
7. Replace the B202 Hybrid/EV Electronics Coolant Temperature Sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B202 Hybrid/EV Electronics Coolant Temperature Sensor.
2. Test for 2 - $2.5\text{k}\ \Omega$ at approximately 21.11°C (70°F) between the signal terminal and the low reference terminal. Refer to [Temperature Versus Resistance](#) for Hybrid/EV Electronics Coolant Temperature Sensor.
 - **If not within the specified range**

Replace the B202 Hybrid/EV Electronics Coolant Temperature Sensor.
 - **If within the specified range**
3. All OK.

DTC Descriptors

DTC P19FA

Hybrid/EV Electronics Coolant Pump Feedback Circuit High Frequency

DTC P19FB

Hybrid/EV Electronics Coolant Pump Feedback Circuit Low Frequency

DTC P19FC

Hybrid/EV Electronics Coolant Pump Feedback Circuit Performance

Circuit/System Description

The hybrid/EV electronics coolant pump circulates coolant through the power electronics coolant radiator, drive motor generator power inverter module, the battery charger, and the 14 V accessory power module to control the temperature of these modules.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV electronics coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV electronics coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P19FA and P19FB

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 11 - 90%.
- All above conditions met for at least 3 seconds.

P19FC

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is disabled for at least 10 seconds.
- DTC P19FC has not already failed when coolant pump was enabled.

OR

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 11 - 90%.
- Hybrid/EV electronics coolant temperature sensor is greater than -20°C (-4°F).
- All above conditions met for at least 5 seconds.
- None of the following DTCs are set: P0CE9, P0CEF, P0CF0, P0CF1, P0CF2, P1F44, or P1F45.

Conditions for Setting the DTC

P19FA

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is greater than 750 Hz.

P19FB

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is less than 8.6 Hz.

P19FC

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is greater than 250 RPM when the pump is not enabled.

OR

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is more than 800 RPM different than the expected pump speed when the pump is commanded between 11 - 90% PWM.

Action Taken When the DTC Sets

DTCs P19FA, P19FB and P19FC are type B DTCs.

Conditions for Clearing the DTC

DTCs P19FA, P19FB and P19FC are type B DTCs.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37°C (-34°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%.

Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is On*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle On.
2. Verify that DTC P0C43, P0C44, P0C45, P0C46, or P0C47 is not set.
 - If any DTC is set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**

3. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV electronics coolant pump between 20% and 90% with a scan tool.

- Hybrid/EV Electronics Coolant Pump Command to be 10% or greater.
- Hybrid/EV Electronics Coolant Pump Feedback to be 50% +/-5%.
- Hybrid/EV Electronics Coolant Pump Speed is greater than 500 RPM.
- **The scan tool parameters listed are not within the specified ranges**

Refer to Circuit/System Testing.

- **The scan tool parameters listed are within the specified ranges**

4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G35 Hybrid/EV Electronics Coolant Pump.

2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.

- **If 5 Ω or greater**

Repair the open/high resistance on the ground circuit.

- **If less than 5 Ω**

3. Vehicle On.

4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.

- **If less than B+**

1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω and the fuse is blown

3. Replace the G35 Hybrid/EV Electronics Coolant Pump.

- **If B+**

5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.

6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.

- **If the test lamp is ON**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the pump enable circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Replace the K114B hybrid/EV powertrain control module 2.

- **If the test lamp is OFF**

7. Vehicle On. Verify the test lamp illuminates. Command the Hybrid/EV Electronics Coolant Pump ON (20 - 90%) with a scan tool if necessary.

- **If the test lamp is OFF**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the pump enable circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the pump enable circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is ON**

8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.

9. Verify that a test lamp changes illumination between bright (20%) and dim (90%) when commanding the Hybrid/EV Electronics Coolant Pump ON between 20% and 90% with a scan tool.

- **If the test lamp is always dim or does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the control circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is always bright**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **The test lamp changes illumination between bright (20%) and dim (90%)**

10. Remove the test lamp.

11. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is 0%.

- **If greater than 0%**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the feedback circuit terminal 2 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If 0%**

12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.

13. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.

- **If 90% or less**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the feedback circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If greater than 90%**

14. Replace the G35 Hybrid/EV Electronics Coolant Pump.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Control Module Coolant Pump Replacement** for Hybrid/EV electronics coolant pump replacement.
- **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P19FD-P19FF: HYBRID/EV BATTERY PACK COOLANT PUMP FEEDBACK CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P19FD

Hybrid/EV Battery Pack Coolant Pump Feedback Circuit High Frequency

DTC P19FE

Hybrid/EV Battery Pack Coolant Pump Feedback Circuit Low Frequency

DTC P19FF

Hybrid/EV Battery Pack Coolant Pump Feedback Circuit Performance

Circuit/System Description

The hybrid/EV battery pack coolant pump circulates coolant through the hybrid/EV battery refrigerant/coolant heat exchanger and the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV battery pack coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Conditions for Running the DTC

P19FD and P19FE

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 11 - 90%.
- All above conditions met for at least 3 seconds.

P19FF

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is disabled for at least 10 seconds.
- DTC P19FF has not already failed when coolant pump was enabled.

OR

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The coolant pump is enabled.
- The coolant pump is commanded between 11 - 90%.
- Hybrid/EV battery pack coolant inlet temperature sensor is greater than -20°C (-4°F).
- All above conditions met for at least 5 seconds.
- None of the following DTCs are set: P0C43, P0C44, P0C45, P0C47, P1E8C, P1E8D, P19FD or P19FE.

Conditions for Setting the DTC

P19FD

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is greater than 750 Hz.

P19FE

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit frequency is less than 8.6 Hz.

P19FF

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is greater than 250 RPM when the pump is not enabled.

OR

The hybrid/EV powertrain control module 2 detects the Coolant Pump Feedback circuit indicated pump speed is more than 800 RPM different than the expected pump speed when the pump is commanded between 11 - 90% PWM.

Action Taken When the DTC Sets

- DTCs P19FD, P19FE and P19FF are type B DTCs.
- Hybrid/EV battery pack active heating and active cooling are disabled.

Conditions for Clearing the DTC

DTCs P19FD, P19FE and P19FF are type B DTCs.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is in Service Mode*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0C43, P0C44, P0C45, P0C46, P1FFB, P1FFC, P1FFD, P1FFE, U0111, U185B, or U2602 is not set.
 - **If any DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**
3. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV battery pack coolant pump between 20% and 90% with a scan tool.
 - Hybrid/EV Battery Pack Coolant Pump Command to be 10% or greater.
 - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
 - Hybrid/EV Battery Pack Coolant Pump Speed is greater than 500 RPM.
 - **The scan tool parameters listed are not within the specified ranges**

Refer to Circuit/System Testing.

- **The scan tool parameters listed are within the specified ranges**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G37 Hybrid/EV Battery Pack Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
 - **If 5 Ω or greater**

Repair the open/high resistance on the ground circuit.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.

- **If less than B+**

1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω and the fuse is blown

3. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

- **If B+**

5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.

6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.

- **If the test lamp is ON**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the pump enable circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Replace the K114B hybrid/EV powertrain control module 2.

- **If the test lamp is OFF**

7. Vehicle ON. Verify the test lamp illuminates. Command the Hybrid Battery Pack Coolant Pump ON (20 - 90%) with a scan tool if necessary.

- **If the test lamp is OFF**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the pump enable circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the pump enable circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is ON**

8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.

9. Verify that a test lamp changes illumination between bright (20%) and dim (90%) when commanding the Hybrid Battery Pack Coolant Pump ON between 20% and 90% with a scan tool.

- **If the test lamp is always dim or does not illuminate**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp is always bright**
1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **The test lamp changes illumination between bright (20%) and dim (90%)**
10. Remove the test lamp.
11. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is 0%.
 - **If greater than 0%**
1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool Hybrid Battery Pack Coolant Pump Feedback parameter is greater than 90%.
 - **If 90% or less**
1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 1 V between the feedback circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 90%**
14. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cooling Fan Speed Signal Circuit	P148B, P1486	P148A, P1485	P148C, P1487	-
Fans operate at 90% with all malfunctions				

Circuit/System Description

The hybrid/EV powertrain control module 2 indirectly controls the radiator fans. When propulsion is active, the engine control module (ECM) processes all requests for the cooling fans to be turned ON regardless of which module originates the request. The ECM decides if and at what speed the cooling fans should operate. The ECM sends the cooling fan command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the signal to the cooling fans to operate and at what speed. If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate and the ECM is not awake, the hybrid/EV powertrain control module 2 will control the cooling fans without ECM intervention.

The ECM communicates the fan command PWM signal to the hybrid/EV powertrain control module 2 through the cooling fan speed signal circuit/hardware circuit and also sends a redundant serial data signal. Since the hardware circuit is an output from the ECM but an input to the hybrid/EV powertrain control module 2, each module has unique DTCs to monitor the same circuit.

Conditions for Running the DTC

P148A

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The propulsion system is active for more than 43 seconds.
- The cooling fan speed request has not changed by greater than 5% for at least 43 seconds.
- None of the following DTCs are set: P148B, P148C, or U0293.

OR

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The propulsion system is inactive.
- The energy storage system thermal condition request is ActiveCool.
- The cooling fans are enabled for more than 43 seconds.
- The cooling fan speed request has not changed by greater than 5% for at least 43 seconds.
- None of the following DTCs are set: P148B, P148C, or U0293.

P148B

The 12 V battery voltage is greater than or equal to 10.2 V.

P148C

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The propulsion system is active for more than 43 seconds.

OR

- The 12 V battery voltage is greater than or equal to 10.2 V.
- The propulsion system is inactive.
- The energy storage system thermal condition request is ActiveCool.
- The cooling fans are enabled for more than 43 seconds.

Conditions for Setting the DTC

P148A

The PWM cooling fan signal circuit duty cycle request from engine control module (Hardwire) is not within 30% of the redundant engine cooling fan speed sent to the hybrid/EV powertrain control module 2 via serial data.

P148B

The hybrid/EV powertrain control module 2 has detected a duty cycle of less than 3% from the engine control module.

P148C

The hybrid/EV powertrain control module 2 has detected a duty cycle of greater than 97% from the engine control module.

Action Taken When the DTC Sets

DTCs P148A, P148B and P148C are type B DTCs.

Conditions for Clearing the DTC

DTCs P148A, P148B and P148C are type B DTCs.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1485, P1486, P1487, P148A, P148B, or P148C is not set.
 - **If the DTC is set**

Refer to Circuit/System Testing.
 - **If the DTC is not set**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module
- 2, vehicle in Service Mode.

NOTE: The cooling fan circuit is pulled up to a voltage within the ECM. 3 - 4 V measured on this circuit with the hybrid/EV powertrain control module 2 disconnected is normal.

2. Test for 3 - 4 V between the cooling fan circuit terminal 9 and ground.

- **If less than 3 V**

1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the cooling fan circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If 4V or greater**

1. Vehicle OFF. Disconnect the X1 harness connector at the K20 Engine Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the cooling fan circuit and ground.

- If greater than 1 V, repair the short to voltage on the circuit.
- If 1 V or less, replace the K20 Engine Control Module.

- **If 3 - 4 V**

3. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.

4. Reconnect the K114B Hybrid/EV Powertrain Control Module 2 connector X2.

5. Vehicle in Service Mode. Test for greater than 10 V between the signal circuit and ground.

- **If 10 V or less**

Replace the Hybrid/EV Powertrain Control Module 2.

- **If greater than 10 V**

6. Replace the K20 Engine Control Module.

DTC P1EC6: HYBRID/EV BATTERY PACK HEATER PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EC6

Hybrid/EV Battery Pack Heater Performance

Circuit/System Description

The hybrid/EV battery pack coolant heater is mounted to the coolant inlet on the back side of the hybrid/EV battery contactor assembly. The hybrid/EV battery pack coolant heater uses the hybrid/EV battery high voltage as its power source. The hybrid/EV battery pack heater high voltage is controlled by a solid state relay/transistor. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage solid state relay/transistor. The hybrid/EV battery pack coolant heater high voltage circuit is fuse protected.

When the Conditions for Running the DTC are met, the hybrid/EV battery pack coolant heater is commanded ON. The hybrid/EV powertrain control module 2 then monitors for a temperature change at the hybrid/EV battery pack coolant temperature sensor 1 to determine if the hybrid/EV battery pack coolant heater is functioning properly.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The hybrid/EV battery pack coolant temperature sensor is less than 20°C (68°F).
- Runs once per drive cycle, either in propulsion system active or in Charge Mode.
- Hybrid/EV battery pack state of charge is greater than 5%.
- Hybrid/EV battery pack voltage is greater than 280 V.
- None of the following DTCs are set; P0C43, P0C44, P0C45, P0C47, P19FD, P19FE, P19FF, P1EC3, P1E8C, P1E8D, P1FFB, P1FFC, P1FFD, or P1FFE.

Conditions for Setting the DTC

- The hybrid/EV powertrain control module 2 commands the hybrid/EV battery pack coolant pump to 7% and the battery heater to 100% for 4 seconds, then varies battery heater output in relation to battery voltage for a maximum of 3 minutes.
- The hybrid/EV powertrain control module 2 did not see the battery pack coolant temperature rise more than 3°C (5.4°F) within 60 seconds of commanding the battery heater OFF.

Action Taken When the DTC Sets

- DTC P1EC6 is a type B DTC.
- Hybrid/EV battery pack active heating is disabled.

Conditions for Clearing the DTC

DTC P1EC6 is a type B DTC.

Diagnostic Aids

P1EC6 will prevent battery heating and the vehicle will be unable to start in cold weather if battery temperature drops below -25°C (-13°F).

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0AA1, P0AA4, P0AD9, P0ADD, P0AE1, P0AE3, P0D0A, P0D09, P1EBD, P1EC0, or P1EC3 is not set.
 - **If any DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**

NOTE: **Other DTCs will set.**

3. Vehicle OFF. Remove the G37 Hybrid/EV Battery Pack Coolant Pump fuse. Set the vehicle Charge Mode to IMMEDIATE. Connect the charge cord set. With the vehicle in Charge Mode, Vehicle in Service Mode.
4. Verify the scan tool Hybrid/EV Battery Pack Coolant Temperature Sensor parameter increases 3Â° C (5.4Â° F) within 120 s when command the hybrid/EV battery pack coolant heater ON with a scan tool.

- If the Hybrid/EV Battery Pack Coolant Temperature Sensor did not increase 3Â° C (5.4Â° F) within 120 s

Refer to Circuit/System Testing.

- If the Hybrid/EV Battery Pack Coolant Temperature Sensor did increase 3Â° C (5.4Â° F) within 120 s

5. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#).
2. Remove the Drive Motor Battery Cover. Refer to [High Voltage Battery Cover Replacement](#). Disconnect the E54 Hybrid/EV Battery Pack Coolant Heater harness connector at the A28 Hybrid/EV Battery Contactor Assembly.

NOTE: The following continuity tests must be performed using the Ohm setting.

3. Test for 61 - 75 Ω between terminal 1 and terminal 2 at the E54 Hybrid/EV Battery Pack Coolant Heater.
 - If not within the specified range

Verify that the battery pack coolant heater fuse is not blown. Replace the fuse if it is blown and the E54 Hybrid/EV Battery Pack Coolant Heater.

- If within the specified range

NOTE: The following continuity tests must be performed using an EL-50772 Insulation Multimeter.

4. Select the Isolation test setting, then select the 500 V range. Refer to [Troubleshooting With an Insulation Multimeter](#) . Test for greater than 550M Ω between the E54 Hybrid/EV Battery Pack Coolant Heater terminals listed below and battery tray ground with the **EL-50772** , set on the Isolation test setting:
 - Terminal 1
 - Terminal 2
 - If less than 550M Ω

NOTE: Also verify that the battery pack coolant heater fuse is not blown.

Replace the E54 Hybrid/EV Battery Pack Coolant Heater.

- If 550M Ω or greater

5. Replace the A28 Hybrid/EV Battery Contactor Assembly.

DTC P1FFB-P1FFE: HYBRID/EV BATTERY PACK COOLANT LEVEL

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1FFB

Hybrid/EV Battery Pack Coolant Level Sensor Circuit

DTC P1FFC

Hybrid/EV Battery Pack Coolant Level Sensor Circuit Low Voltage

DTC P1FFD

Hybrid/EV Battery Pack Coolant Level Sensor Circuit High Voltage

DTC P1FFE

Hybrid/EV Battery Pack Coolant Level Low

Circuit/System Description

The hybrid/EV battery pack coolant system has a level sensor. The hybrid/EV battery pack coolant level sensor is attached to the coolant surge tank. The level sensor is a 2 state bi-metallic reed switch which changes state when the switch reed is exposed to magnetism. The level of the hybrid/EV battery pack coolant in the surge tank causes a magnet-equipped float to move towards and away from the sensor as coolant level decreases or increases. The hybrid/EV powertrain control module 2 supplies 5 V to the signal circuit and a ground for the low reference circuit. The hybrid/EV battery pack coolant level sensor resistance decreases when the battery coolant level in the surge tank gets low. The hybrid/EV powertrain control module 2 uses the hybrid/EV battery pack coolant level sensor to determine if the hybrid/EV battery pack coolant system is low on coolant.

Conditions for Running the DTC

P1FFB, P1FFC, and P1FFD

The 12 V battery voltage is greater than 10.2 V.

P1FFE

- The vehicle speed is zero for more than 30 seconds
- The battery pack temperature is between 0Â°C (32Â°F) and 120Â°C (248Â°F)
- None of the following DTCs are set: P0721, P077B, P215C, P2610, U0100 or U0101
- Once set, the DTC will not run again until a scan tool clear code command is sent.

Conditions for Setting the DTC

P1FFB

The hybrid/EV battery pack coolant level sensor voltage is between 2.8 V - 3.1 V

P1FFC

The hybrid/EV battery pack coolant level sensor voltage is below 1.37 V

P1FFD

The hybrid/EV battery pack coolant level sensor voltage is above 4.0 V

P1FFE

The hybrid/EV battery pack coolant level sensor voltage is between 1.38 - 2.84 V for more than 2 consecutive key cycles

Action Taken When the DTC Sets

- DTC P1FFB, P1FFC, P1FFD, and P1FFE are type A DTCs.
- The driver information center (DIC) displays the SERVICE HIGH VOLTAGE CHARGING SYSTEM message.
- Hybrid/EV battery pack charging is disabled.

- Hybrid/EV battery pack active heating and active cooling are disabled.
- DTC P1FFF is set.

Conditions for Clearing the DTC

- DTC P1FFB, P1FFC, and P1FFD are type A DTCs.
- DTC P1FFE is a type A DTC but will only clear with a scan tool clear code command.

Diagnostic Aids

- Parking the vehicle on a steep incline may set DTC P1FFE.
- DTC P1FFE will not clear or go to history with ignition cycles once DTC is set. DTC P1FFE will only clear with a scan tool clear code command.

Circuit/System Verification

1. Verify that the vehicle hybrid/EV battery cooling system is full.
 - If the hybrid/EV battery cooling system is low

WARNING: Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can

cause severe injury or death.

Refer to Hybrid Cooling System Loss of Coolant (Battery), **Hybrid Cooling System Loss of Coolant (Power Electronics)Hybrid Cooling System Loss of Coolant (Battery)**

- **If the hybrid/EV battery cooling system is full**

2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the harness connector at the B258 Hybrid/EV Battery Coolant Level Sensor.

2. Test for less than 10 Ω between the low reference circuit terminal B and ground.

- **If 10 Ω or greater**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between the 5 V signal circuit terminal A and ground.

- **If 4.8 V or less**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If 5.2 V or greater**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If within the specified range**

5. Vehicle OFF, remove the B258 Hybrid/EV Battery Coolant Level Sensor from the coolant surge tank.

NOTE: **The coolant sensor must be removed from the coolant surge tank to ensure the coolant float magnet does not close the internal reed switch.**

6. Test for 24 - 25.4k Ω between the signal terminal A and the low reference terminal B.

- **If not within the specified range**

Replace the B258 Hybrid/EV Battery Coolant Level Sensor.

- **If within the specified range**

NOTE: Moving the magnet slightly along the bottom of the sensor will assist closing the internal switch.

7. Using a magnet, place the magnet off center of the B258 Hybrid/EV Battery Coolant Level Sensor, opposite of the terminals on the epoxy side to close the internal reed switch.

8. Test for 7.1 - 7.54k Ω between the signal terminal A and the low reference terminal B.

- **If not within the specified range**

Replace the B258 Hybrid/EV Battery Coolant Level Sensor.

- **If within the specified range**

9. Replace the coolant surge tank.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Control Module References](#) for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1FFF: SYSTEM ISOLATION/COOLANT LEVEL SENSOR FAULT - HYBRID/EV BATTERY CHARGING SYSTEM DISABLED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1FFF

System Isolation/Coolant Level Sensor Fault - Hybrid/EV Battery Charging System Disabled

Circuit/System Description

This diagnostic is an indicator that hybrid/EV battery pack charging is disabled because the hybrid/EV powertrain control module 2 detected one of the following conditions:

WARNING: Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.

- A loss of isolation between the hybrid/EV battery pack high voltage circuits and vehicle chassis
- A low coolant condition of the hybrid/EV battery pack coolant system
- A fault in the hybrid/EV battery pack coolant level sensor/circuit

Conditions for Running the DTC

- The hybrid powertrain control module 2 and battery energy control module are awake and communicating.
- Once set, the DTC will not run again until a scan tool clear code command is sent.

Conditions for Setting the DTC

NOTE: DTC P1FFF will never set alone.

When DTC P0AA6, P1AE6, P1FFB, P1FFC, P1FFD, or P1FFE is set, DTC P1FFF will also be set.

Action Taken When the DTC Sets

- DTC P1FFF is a type A DTC.
- The driver information center (DIC) displays the SERVICE HIGH VOLTAGE CHARGING SYSTEM message.
- Hybrid/EV battery pack charging is disabled.
- Hybrid/EV battery pack active cooling is disabled.

Conditions for Clearing the DTC

DTC P1FFF is a type A DTC but will only clear with a scan tool clear code command.

Diagnostic Aids

- DTC P1FFF will not clear or go to history with ignition cycles once DTC is set.
- DTC P1FFF will only clear with a scan tool clear code command.

HYBRID/EV BATTERY PACK COOLANT PUMP MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Circuit/System Description

The hybrid/EV battery pack coolant pump circulates coolant through the hybrid/EV battery refrigerant/coolant heat exchanger and the hybrid/EV battery pack to control the temperature of the hybrid/EV battery pack.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV battery pack coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV battery pack coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV battery pack coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV battery pack coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37°C (-34°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is On*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*

Displayed PWM Value	Pump Self-Diagnostic Indication
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Vehicle On.
2. Verify that DTC P0C47, P1E8C, P1E8D, P19FD, P19FE, or P19FF is not set.
 - **If any DTC is set**
 Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
 - **If none of the DTCs are set**
3. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV battery pack coolant pump between 20% and 90% with a scan tool.
 - Hybrid/EV Battery Pack Coolant Pump Command to be 10% or greater.
 - Hybrid/EV Battery Pack Coolant Pump Feedback to be 50% +/-5%.
 - Hybrid/EV Battery Pack Coolant Pump Speed is greater than 500 RPM.
 - **The scan tool parameters listed are not within the specified ranges**
 Refer to Circuit/System Testing.
 - **The scan tool parameters listed are within the specified ranges**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G37 Hybrid/EV Battery Pack Coolant Pump.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.

- **If 5 Ω or greater**

Repair the open/high resistance on the ground circuit.

- **If less than 5 Ω**

3. Vehicle On.
4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.

- **If less than B+**

1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω and the fuse is blown

3. Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

- **If B+**

5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.
6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.

- **If the test lamp is ON**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the pump enable circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Replace the K114B hybrid/EV powertrain control module 2.

- **If the test lamp is OFF**

7. Vehicle On. Verify the test lamp illuminates. Command the Hybrid/EV Battery Pack Coolant Pump ON (20 - 90%) with a scan tool if necessary.

- **If the test lamp is OFF**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the pump enable circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the pump enable circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp is ON**

8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
9. Verify that a test lamp changes illumination between bright (20%) and dim (90%) when commanding the Hybrid/EV Battery Pack Coolant Pump ON between 20% and 90% with a scan tool.
 - **If the test lamp is always dim or does not illuminate**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp is always bright**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **The test lamp changes illumination between bright (20%) and dim (90%)**
10. Remove the test lamp.
11. Verify the scan tool Hybrid/EV Battery Pack Coolant Pump Feedback parameter is 0%.
 - **If greater than 0%**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool Hybrid/EV Battery Pack Coolant Pump Feedback parameter is greater than 90%.
 - **If 90% or less**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the feedback circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If greater than 90%**

14. Connect the G37 Hybrid/EV Battery Pack Coolant Pump.

15. Vehicle On.

16. Place your hand on the coolant pump and verify that pump operation is felt when commanding the Hybrid/EV Battery Pack Coolant Pump ON to 90% with a scan tool.

- **If pump operation cannot be felt at 90%**

Replace the G37 Hybrid/EV Battery Pack Coolant Pump.

- **If pump operation is felt at 90%**

17. All OK. Refer to [Hybrid/EV Battery Cooling Diagnostic](#) to verify for proper flow of the coolant pump and system.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Drive Motor Battery Coolant Pump Replacement](#)
- [Control Module References](#) for hybrid/EV powertrain control module 2 replacement, programming and setup.

HYBRID/EV ELECTRONICS COOLANT PUMP MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Circuit/System Description

The hybrid/EV electronics coolant pump circulates coolant through the power electronics coolant radiator, drive motor generator power inverter module, the battery charger, and the 14V accessory power module to control the temperature of these modules.

The Enable, Control and Feedback circuits connect the hybrid/EV powertrain control module 2 to the hybrid/EV electronics coolant pump.

When the Enable circuit is high, the pump is allowed to operate as specified by the Control circuit signal. The pulse-width modulated Control circuit signal from the hybrid/EV powertrain control module 2 determines the hybrid/EV electronics coolant pump speed. The higher the duty cycle the higher the pump speed. The hybrid/EV electronics coolant pump utilizes a pulse-width modulated signal on the Feedback circuit to the hybrid/EV powertrain control module 2. During normal operation, the feedback circuit provides pump speed information to the hybrid/EV powertrain control module 2. If the hybrid/EV electronics coolant pump determines there is an internal fault it provides this information on the same feedback circuit instead of pump speed information.

Diagnostic Aids

- Always verify coolant freeze point protection if a fault occurs in cold climate conditions. An improper coolant to water ratio may result in slushy or frozen coolant, resulting in DTCs or overheating. Measure coolant concentration using the **J-26568** refractometer or equivalent to verify a 50/50 mix and freeze protection to -37Â°C (-34Â°F).
- The Coolant Pump Feedback parameter on the scan tool indicates the status of the pump. When the pump self-diagnostics indicate normal operation, the parameter will indicate a PWM between 45 and 55%. Different PWM values will identify when a pump self-diagnostic has failed:

Coolant Pump Feedback Parameter

Displayed PWM Value	Pump Self-Diagnostic Indication
0%	Pump has lost power/ground, feedback circuit open, or Vehicle is On*
10%	Pump Under Voltage detected*
20%	Pump Under/Over Current detected*
30%	Blocked or Dry pump detected*
45-55%	Normal operation, actual pump speed provided by circuit frequency
80%	Pump Over Voltage detected*
90%	Pump Over Temperature detected*
100%	Feedback circuit shorted to ground*
*Coolant Pump Speed parameter defaults to 50 RPM, actual pump speed is 0 RPM.

Circuit/System Verification

1. Vehicle On.

2. Verify that DTC P0CE9, P1F44, P1F45, P19FA, P19FB, or P19FC is not set.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If none of the DTCs are set**

3. Verify the hybrid/EV powertrain control module 2 parameters listed below when commanding the hybrid/EV electronics coolant pump between 20% and 90% with a scan tool.

- Hybrid/EV Electronics Coolant Pump Command to be 10% or greater.
- Hybrid/EV Electronics Coolant Pump Feedback to be 50% +/-5%.
- Hybrid/EV Electronics Coolant Pump Speed is greater than 500 RPM.
- **The scan tool parameters listed are not within the specified ranges**

Refer to Circuit/System Testing.

- **The scan tool parameters listed are within the specified ranges**

4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G35 Hybrid/EV Electronics Coolant Pump.

2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.

- **If 5 Ω or greater**

Repair the open/high resistance on the ground circuit.

- **If less than 5 Ω**

3. Vehicle On.

4. Test for B+ between the B+ circuit terminal 5 and the ground circuit terminal 4.

- **If less than B+**

1. Vehicle OFF, test for infinite resistance between the B+ circuit terminal 5 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω and the fuse is blown

3. Replace the G35 Hybrid/EV Electronics Coolant Pump.

- **If B+**

5. Connect a test lamp between the enable circuit terminal 1 and the ground circuit terminal 4.

6. Vehicle OFF, charge cord removed. Verify the test lamp is OFF.

- **If the test lamp is ON**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for less than 1 V between the pump enable circuit terminal and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V
3. Replace the K114B hybrid/EV powertrain control module 2.
 - **If the test lamp is OFF**
7. Vehicle On. Verify the test lamp illuminates. Command the Hybrid/EV Electronics Coolant Pump ON (20 - 90%) with a scan tool if necessary.
 - **If the test lamp is OFF**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the pump enable circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the pump enable circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp is ON**
 8. Connect a test lamp between the control circuit terminal 3 and the B+ circuit terminal 5.
 9. Verify that a test lamp changes illumination between bright (20%) and dim (90%) when commanding the Hybrid/EV Electronics Coolant Pump ON between 20% and 90% with a scan tool.
 - **If the test lamp is always dim or does not illuminate**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the control circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp is always bright**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **The test lamp changes illumination between bright (20%) and dim (90%)**
 10. Remove the test lamp.
 11. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is 0%.
 - **If greater than 0%**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

2. Test for infinite resistance between the feedback circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If 0%**
12. Install a 3 A fused jumper wire between the feedback circuit terminal 2 and the ground circuit terminal 4.
13. Verify the scan tool Hybrid/EV Electronics Coolant Pump Feedback parameter is greater than 90%.
 - **If 90% or less**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the feedback circuit terminal and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the feedback circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 90%**
14. Connect the G35 Hybrid/EV Electronics Coolant Pump.
15. Vehicle On.
16. Place your hand on the coolant pump and verify that pump operation is felt when commanding the Hybrid/EV Electronics Coolant Pump ON to 90% with a scan tool.
 - **If pump operation cannot be felt at 90%**

Replace the G35 Hybrid/EV Electronics Coolant Pump.

 - **If pump operation is felt at 90%**
17. Electronic control of the pump is OK. Verify for proper flow of the coolant pump and system.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Generator Control Module Coolant Pump Replacement** for Hybrid/EV electronics coolant pump replacement.
- **Control Module References** for hybrid/EV powertrain control module 2 replacement, programming and setup.

HYBRID COOLING SYSTEM LOSS OF COOLANT (POWER ELECTRONICS)

Step	Action	Yes	No
1	Inspect the coolant level. Is the coolant at the proper level?	Go to Step 13	Go to Step 2
2	Fill the cooling system to the proper level. Refer to <u>Drive Motor Generator Power Inverter Module Cooling System Draining and Filling.</u>	Go to Step 3	-

Step	Action	Yes	No
	Is the action complete?		
3	Overheating can cause a loss of coolant. Is the Hybrid/EV Electronics Cooling Diagnostic overheating?	Go to Step 11	Go to Step 4
4	Visually inspect the hoses, pipes and hose clamps. Are any of the hoses, clamps or pipes leaking?	Go to Step 12	Go to Step 5
5	Visually inspect the following components: • Coolant surge tank • Coolant hoses and pipes • Generator control module coolant Pump • Air conditioning condenser • Accessory DC power control module • Drive motor battery charger Are any of the listed components leaking?	Go to Step 12	Go to Step 6
6	1. Pressure test the cooling system. Refer to Hybrid Cooling System Leak Test . 2. With the cooling system pressurized, visually inspect the components listed in step 5. Are any leaks present?	Go to Step 12	Go to Step 7
7	Pressure test the coolant pressure cap. Refer to Hybrid Cooling System Pressure Cap Testing . Does the coolant pressure cap hold pressure?	Go to Step 9	Go to Step 8
8	Replace the coolant pressure cap. Is the repair complete?	Go to Step 13	-
9	1. Pressure test the cooling system. Refer to Hybrid Cooling System Leak Test . 2. With the cooling system pressurized, remove the engine cooling system pressure cap. Does the hybrid cooling system hold pressure?	-	Go to Step 10
10	Replace the surge tank-drive motor generator power inverter module. Refer to Radiator Surge Tank Replacement (Drive Motor Battery Radiator Surge Tank) Radiator Surge Tank Replacement (Drive Motor Generator Power Inverter Module Surge Tank) . Is the repair complete?	Go to Step 13	-
11	Repair the hybrid cooling system overheating condition. Refer to Hybrid/EV Battery Cooling Diagnostic . Is the repair complete?	Go to Step 13	-
12	Repair or replace the leaking component. Refer to the appropriate repair.	Go to Step 13	-

Step	Action	Yes	No
	Is the repair complete?		
13	Operate the system in order to verify the repair. NOTE: Do not use stop leak or any other chemicals. Only use premix Dexcool (50/50 mixture of Dexcool and deionized) Did you find and correct the condition?	System OK	Go to Step 2

HYBRID COOLING SYSTEM LOSS OF COOLANT (BATTERY)

Step	Action	Yes	No
DEFINITION: Perform this procedure in conjunction with a high-voltage battery overheating condition, low coolant in the high-voltage battery surge tank, or when instructed to by DTC P1FFE, P1AE6, or P0AA6 diagnostic procedures. WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: • Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors • Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather			

Step	Action	Yes	No
	protectors • Visually and functionally inspect the gloves before use. • Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not. Failure to follow the procedure exactly as written may result in serious injury or death. WARNING: Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly.		

Step	Action	Yes	No
Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.			
1	Raise and support the hood with prop rod. Was the hood raised and supported with the prop rod?	Go to Step 2	Go to Step 1
2	 Visually inspect the coolant level in the high-voltage battery surge tank. Is the coolant level at the fill line (1)?	Go to Step 3	Go to Step 4
3	Are any of the following DTCs present? • P0AA6 (Hybrid/EV Battery Voltage System Isolation Lost) • P1AE6 (Battery Energy Control Module Hybrid/EV Battery Voltage Isolation Sensor Circuit) • P1FFE (Hybrid/EV Battery Pack Coolant Level Low)	Perform DTC Diagnostics.	Go to Step 4
4	Inspect the HV battery for internal coolant leakage. Did coolant flow from drive motor battery?	Then Go to Step 5	Go to Step 6
5	Call the GM Technical Assistance Center (TAC) for further instructions. DO NOT ATTEMPT TO REPAIR VEHICLE WITHOUT CALLING TAC. Was TAC called?	Go to Step 6	Go to Step 5
6	Inspect the coolant cap for proper seat. Was the coolant cap loosen?	Go to Step 7	Go to Step 6

Step	Action	Yes	No
7	Special Tools:  <u>Fig. 5: Radiator Cap And Surge Tank Test Adapter</u> • EN-24460-A cooling system pressure tester • GE-46143 radiator cap and surge tank test adapter (1) Pressure test high-voltage battery cooling loop and pressure cap to 34.4 kPa (5 psi). Does the system hold pressure for at least five minutes?	Go to Step 9	Go to Step 8
8	NOTE: When raising vehicle on hoist, vehicle must be level. Visually inspect the following components-Also inspect their hoses, clamps, and hose connections for coolant leaks: • Coolant surge tank • Air separator • HV battery radiator • HV battery coolant pump • HV battery chiller • HV battery assembly Was a coolant leak found?	Replace component(s), hose(s), or clamp(s) that is/are leaking. Refer to appropriate procedure(s). Validate repair with additional pressure test. Then Go to Step 9	Go to Step 9
9	Special Tools: • GE-26568 Coolant and Battery Tester • GE-47716-A Vac-N-Fill Coolant Refill Tool • GE-46143 Radiator Cap and Surge Tank Test Adapter Fill and adjust high-voltage battery cooling system level at the surge tank. Refer to <u>Drive Motor Battery Cooling</u>	Go to Step 10	Go to Step 9

Step	Action	Yes	No
	<u>System Draining and Filling.</u> Was the high-voltage battery cooling system level filled and adjusted at the surge tank?		
10	Verify the following before returning vehicle to customer: • Coolant level is at the top of the full line of the high-voltage battery surge tank. • Coolant Cap is reinstalled. • DTC P1FFE (Hybrid/EV Battery Pack Coolant Level Low) is cleared from ECU. Did you find and correct the condition?	System OK	Go to Step 1

HYBRID COOLING SYSTEM PRESSURE CAP TESTING

Special Tools

- **GE-46143** Radiator Cap and Surge Tank Test Adapter
- **EN-24460-A** Cooling System Pressure Tester

For equivalent regional tools, Refer to [Special Tools](#)

Pressure Cap Testing

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the pressure cap.
2. Wash the pressure cap sealing surface with water.

Fig. 6: Identifying Pressure Cap Tester

Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate GE-46143 Radiator Cap and Surge Tank Test Adapter and pressure cap O-rings with coolant and press cap to seat O-ring on GE-46143 Radiator Cap and Surge Tank Test Adapter before turning to engage threads.

3. Use the **EN-24460-A** Cooling System Pressure Tester (1) with **GE-46143** Radiator Cap and Surge Tank Test Adapter (2) in order to test the pressure cap.
4. Test the pressure cap for the following conditions:
 - Pressure release when the **EN-24460-A** Cooling System Pressure Tester exceeds the pressure rating of the pressure cap.
 - Maintain the rated pressure for at least 10 seconds.

Note the rate of pressure loss.

5. Replace the pressure cap under the following conditions:
 - The pressure cap does not release pressure which exceeds the rated pressure of the cap.
 - The pressure cap does not hold the rated pressure.

HYBRID COOLING SYSTEM LEAK TEST

Special Tools

- **EN-24460-A** Cooling System Pressure Tester
- **GE-46143** Radiator Cap and Surge Tank Test Adapter

For equivalent regional tools, Refer to [Special Tools](#)

WARNING: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

WARNING: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

1. Remove the pressure cap.
2. Test the operation of the pressure cap. Refer to [Hybrid Cooling System Pressure Cap Testing](#).
3. Wash the pressure cap mating surface with water.

Fig. 7: Cooling System Pressure Tester Components

Courtesy of GENERAL MOTORS COMPANY

4. Use the **EN-24460-A** Cooling System Pressure Tester with the **GE-46143** Radiator Cap and Surge Tank Test Adapter in order to apply pressure to the cooling system.

Do not exceed the pressure cap rating.

5. The cooling system should hold the rated pressure for at least 2 minutes.

Observe the gauge for any pressure loss.

NOTE: Do not use stop leak or any other chemicals. Only use premix Dexcool (50/50 mixture of Dexcool and deionized)

6. Repair any leaks as required.

REPAIR INSTRUCTIONS

DRIVE MOTOR BATTERY COOLING SYSTEM DRAINING AND FILLING

Special Tools

- **GE-26568** Coolant and Battery Tester
- **GE-46143** Cooling System Adapter
- **GE-47716** Vac-N-Fill Coolant Refill Tool
- **GE-50385** Battery Pack Coolant Adapters
- **EL-51753** Battery Leak Test Kit
- **EL-50812** Battery Leak Test Kit

Equivalent regional tools: [Special Tools](#).

WARNING: Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

WARNING: Do NOT attempt to repair a Lithium Ion Hybrid/EV Battery Pack when an internal coolant leak is evident. The Hybrid/EV Battery Pack must always be replaced as an assembly. Failure to replace a coolant contaminated Hybrid/EV Battery Pack may result in fire, which can cause severe injury or death.

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

NOTE: If system is being drained to perform internal service or replacement of the high-voltage battery, it is necessary to purge the high-voltage battery of any residual coolant. Refer to the High-Voltage Battery Coolant Purge procedure at the end of this procedure.

Drain Points

Fig. 8: Battery Inlet And Outlet Branch Drain Point
Courtesy of GENERAL MOTORS COMPANY

1. The graphic shows the 2 draining points:
 1. Battery Inlet Branch Drain Point (1)
 2. Battery Outlet Branch Drain Point (2)

Draining Procedure

NOTE:

- Draining of the cooling system or replacement of any drive motor battery cooling system parts requires the actuation of the Hybrid/EV Battery Pack Coolant Pump Bleed Procedure in the GDS tool.
- To completely drain the high-voltage battery cooling system, coolant must be drained from three locations: The inlet branch quick connect, the outlet branch quick connect, and the inlet & outlet pipes at the high-voltage battery.
- If draining the system for high-voltage battery internal service or replacement, it is necessary to purge all coolant from the battery using an additional procedure. Go to Purging & Remove of Coolant from Battery .

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain battery coolant inlet branch. Disconnect the battery coolant pump outlet hose at the chiller inlet pipe at the right frame rail. [Drive Motor Battery Coolant Cooler Inlet Hose Replacement \(Pump Outlet to Chiller Inlet\)](#)[Drive Motor Battery Coolant Cooler Inlet Hose Replacement \(Tube Assembly to Chiller\)](#) (Tube Assembly to Chiller).
3. Drain battery coolant outlet branch. Disconnect the high-voltage battery outlet pipe at the surge tank inlet hose quick connect near the left frame rail. [Drive Motor Control Module Radiator Outlet Hose Replacement](#).
4. Drain the inlet and outlet branch at the battery. Disconnect high-voltage battery inlet pipe and outlet pipe. Refer to [Drive Motor Control Module Radiator Inlet Hose Replacement](#) (Drive Motor Battery to Tube).

Vac-N-Fill Procedure

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

Fig. 9: Radiator Cap & Surge Tank Test Adapter

Courtesy of GENERAL MOTORS COMPANY

NOTE: To prevent boiling of the coolant/water mixture in the vehicles cooling system, do not apply vacuum to a cooling system above 49°C (120°F). The tool will not operate properly when the coolant is boiling.

2. Install **GE-46143** adapter.
3. Attach the Van-N-Fill cap (1) to **GE-46143** adapter.

Fig. 10: Vacuum Gauge Assembly & Vac N Fill Cap
Courtesy of GENERAL MOTORS COMPANY

4. Attach the vacuum gauge assembly (1) to the Vac-N-Fill cap (2).

Fig. 11: Vacuum Gauge Assembly & Fill Hose
Courtesy of GENERAL MOTORS COMPANY

5. Attach the fill hose (1) to the barb fitting on the vacuum gauge assembly (2).

Ensure that the valve is closed.

Fig. 12: Graduated Reservoir, Vacuum Tank & Cut-Out Area

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a Pre-mixed DEXCOOLÂ® (50/50 mixture of DEXCOOLÂ® and deionized water). Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

6. Pour the coolant mixture into the graduated reservoir (1).
7. Place the fill hose in the graduated reservoir (1).

NOTE: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

8. Install the vacuum tank (2) on the graduated reservoir with the fill hose routed through the cut-out area (3) in the vacuum tank.

Fig. 13: Vacuum Tank & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Attach the venturi assembly (1) to the vacuum tank (2).

Fig. 14: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

10. Attach a shop air hose to the venturi assembly (1).

Ensure the valve (2) on the venturi assembly is closed.

Fig. 15: Vacuum Hose, Gauge Assembly & Tank
Courtesy of GENERAL MOTORS COMPANY

11. Attach the vacuum hose (1) to the vacuum gauge assembly (2) and the vacuum tank (3).

Fig. 16: Valve & Venturi Assembly

Courtesy of GENERAL MOTORS COMPANY

12. Open the valve (1) on the venturi assembly (2). The vacuum gauge will begin to rise and a hissing noise will be present.

Fig. 17: Vacuum Gauge Needle

Courtesy of GENERAL MOTORS COMPANY

13. Continue to draw vacuum until the needle stops rising (1). This should be 610 - 660 mm Hg (24 - 26 in Hg).

Cooling hoses may start to collapse. This is normal due to vacuum draw.

14. To aid in the fill process, position the graduated reservoir above the coolant fill port.

Fig. 18: Vacuum Gauge Assembly & Needle
Courtesy of GENERAL MOTORS COMPANY

15. Slowly open the valve (1) on the vacuum gauge assembly (2). When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.
16. Close the valve on the venturi assembly.
17. If there is a suspected leak in the cooling system, allow the system to stabilize under vacuum and monitor for vacuum loss.

If vacuum loss is observed, refer to [Hybrid Cooling System Loss of Coolant \(Power Electronics\)](#)[Hybrid Cooling System Loss of Coolant \(Battery\)](#).

18. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

Fig. 19: Vacuum Gauge

Courtesy of GENERAL MOTORS COMPANY

19. Once the vacuum gauge (1) reaches zero, close the valve on the vacuum gauge assembly and repeat steps 12 - 18.
20. Place vehicle in Service Mode. With the GDS scan tool, activate the hybrid/EV battery pack coolant pump for 5 minutes while maintaining 381 mm (15 in Hg) vacuum throughout the process. The pump can be activated by navigating to the following location:
 1. Module Diagnostics
 2. Hybrid Powertrain Control Module 2
 3. Control Functions
 4. Hybrid/EV Battery Pack Coolant Pump
 5. Command Pump to 80%
21. Detach the Vac-N-Fill cap from the **GE-46143** adapter.
22. Remove **GE-46143** adapter from the surge tank fill neck.

Fig. 20: Surge Tank

Courtesy of GENERAL MOTORS COMPANY

23. Upon completion of the hybrid/EV battery pack coolant pump activation, adjust the surge tank coolant level to the FULL COLD line on the side of the surge tank (1).
24. Inspect the concentration of the coolant mixture using **GE-26568** tester.

REMOVING EXCESS COOLANT FROM SYSTEM

NOTE: After filling the cooling system, the extraction hose can be used to remove excess coolant to achieve the proper coolant level.

1. Detach the vacuum hose from the vacuum gauge assembly.

Fig. 21: Vacuum Hose & Extraction Hose
Courtesy of GENERAL MOTORS COMPANY

2. Attach the extraction hose (1) to the vacuum hose (2).

Fig. 22: Venturi Assembly & Valve

Courtesy of GENERAL MOTORS COMPANY

3. Open the valve (1) on the venturi assembly (2) to start a vacuum draw.

Fig. 23: Extraction Hose And Surge Tank
Courtesy of GENERAL MOTORS COMPANY

4. Assemble the extraction hose (1) and insert into the surge tank (2).

Fig. 24: Surge Tank

Courtesy of GENERAL MOTORS COMPANY

5. Adjust the surge tank coolant level to the FULL COLD line on the side of the surge tank (1).
6. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

PURGING & REMOVAL OF COOLANT FROM BATTERY

NOTE: Prior to performing high-voltage battery internal service, it is necessary to purge any residual coolant inside the battery that is left over from the cooling system draining procedure. Similarly, coolant must be removed from the battery prior to return shipping. This procedure must also be used when purging complete system of contaminated coolant.

NOTE: This procedure can be performed in vehicle, or with battery removed from vehicle.

Fig. 25: Plugs From Battery Leak Test Kits

Courtesy of GENERAL MOTORS COMPANY

1. Install necessary plugs from **EL-50812** & **EL-51753** Battery Leak Test Kits (1, 2).
2. Install **GE-50385** Battery Pack Coolant Adapters to the battery coolant ports.
3. Connect the **GE-47716** Vac N Fill vacuum hose to the **GE-50385** adapter with thru-port.

Fig. 26: Connect Other End Of Vacuum Hose to Vac N Fill Vacuum Tank
Courtesy of GENERAL MOTORS COMPANY

4. Connect other end of vacuum hose to the Vac N Fill vacuum tank.
5. Install the venturi assembly to the vacuum tank with valve closed.
6. Attached regulated shop air supply hose to venturi assembly.
7. Open valve on venturi assembly to apply vacuum to high-voltage battery internal coolant loop.
8. Build vacuum for at least one minute.

Fig. 27: GE-50385 Plug to Break Vacuum And Purge Battery Of Coolant
Courtesy of GENERAL MOTORS COMPANY

9. Temporarily remove **GE-50385** plug to break vacuum and purge battery of coolant.
10. Install plug to build vacuum again.
11. Repeat step 7-9 several times until no more coolant can be extracted.

DRIVE MOTOR GENERATOR POWER INVERTER MODULE COOLING SYSTEM DRAINING AND FILLING

Special Tools

- **GE-26568** Coolant and Battery Tester
- **GE-47716** Vac-N-Fill Coolant Refill Tool
- **BO-38185** Hose Clamp Pliers

Equivalent regional tools: **Special Tools**

WARNING: Before conducting any repair to this high voltage cooling system, it is

necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

Draining Procedure

1. Turn Vehicle Power Off and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Raise and support the vehicle. [Lifting and Jacking the Vehicle](#)
3. Remove [Front Wheelhouse Liner Replacement \(Left Side\)](#) [Front Wheelhouse Liner Replacement \(Right Side\)](#)

Fig. 28: Clamp And Coolant Hose

Courtesy of GENERAL MOTORS COMPANY

4. Loosen Clamp (2) **BO-38185** pliers
5. Remove Coolant Hose (1)
6. Lower the vehicle.

Vac-N-Fill Procedure

1. Turn Vehicle Power Off and remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

Fig. 29: Radiator Cap & Surge Tank Test Adapter
Courtesy of GENERAL MOTORS COMPANY

NOTE: To prevent boiling of the coolant/water mixture in the vehicles cooling system, do not apply vacuum to a cooling system above 49°C (120°F). The tool will not operate properly when the coolant is boiling.

2. Install **GE-46143** cooling system adapter
3. Attach the Vac-N-Fill cap (1) to **GE-46143** cooling system adapter.

Fig. 30: Vacuum Gauge Assembly & Vac N Fill Cap
Courtesy of GENERAL MOTORS COMPANY

4. Attach the vacuum gauge assembly (1) to the Vac-N-Fill cap (2).

Fig. 31: Vacuum Gauge Assembly & Fill Hose
Courtesy of GENERAL MOTORS COMPANY

5. Attach the fill hose (1) to the barb fitting on the vacuum gauge assembly (2).

Ensure that the valve is closed.

Fig. 32: Graduated Reservoir, Vacuum Tank & Cut-Out Area

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a Pre-mixed DEXCOOLÂ® (50/50 mixture of DEXCOOLÂ® and deionized water). Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

6. Pour the coolant mixture into the graduated reservoir (1).

7. Place the fill hose in the graduated reservoir (1).

NOTE: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

8. Install the vacuum tank (2) on the graduated reservoir with the fill hose routed through the cut-out area (3) in the vacuum tank.

Fig. 33: Vacuum Tank & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

9. Attach the venturi assembly (1) to the vacuum tank (2).

Fig. 34: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

10. Attach a shop air hose to the venturi assembly (1).

Ensure the valve (2) on the venturi assembly is closed.

Fig. 35: Vacuum Hose, Gauge Assembly & Tank
Courtesy of GENERAL MOTORS COMPANY

11. Attach the vacuum hose (1) to the vacuum gauge assembly (2) and the vacuum tank (3).

Fig. 36: Valve & Venturi Assembly

Courtesy of GENERAL MOTORS COMPANY

12. Open the valve (1) on the venturi assembly (2). The vacuum gauge will begin to rise and a hissing noise will be present.

Fig. 37: Vacuum Gauge Needle

Courtesy of GENERAL MOTORS COMPANY

13. Continue to draw vacuum until the needle stops rising (1). This should be 610 - 660 mm Hg (24 - 26 in Hg).

Cooling hoses may start to collapse. This is normal due to vacuum draw.

14. To aid in the fill process, position the graduated reservoir above the coolant fill port.

Fig. 38: Vacuum Gauge Assembly & Needle
Courtesy of GENERAL MOTORS COMPANY

15. Slowly open the valve (1) on the vacuum gauge assembly (2). When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.
16. Close the valve on the venturi assembly.
17. If there is a suspected leak in the cooling system, allow the system to stabilize under vacuum and monitor for vacuum loss.

If vacuum loss is observed, refer to [Loss of Coolant](#) .

18. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

Fig. 39: Vacuum Gauge At Zero

Courtesy of GENERAL MOTORS COMPANY

19. Once the vacuum gauge reaches zero (1), close the valve on the vacuum gauge assembly and repeat steps 12 - 18.
20. Detach the Vac-N-Fill cap from the **GE-46143** adapter.
21. Remove **GE-46143** adapter from the surge tank fill neck.
22. Add coolant to the system as necessary.
23. Inspect the concentration of the coolant mixture using **GE-26568** tester.

NOTE: After filling the cooling system, the extraction hose can be used to remove excess coolant to achieve the proper coolant level.

24. Detach the vacuum hose from the vacuum gauge assembly.

Fig. 40: Vacuum Hose & Extraction Hose
Courtesy of GENERAL MOTORS COMPANY

25. Attach the extraction hose (1) to the vacuum hose (2).

Fig. 41: Venturi Assembly & Valve
Courtesy of GENERAL MOTORS COMPANY

26. Open the valve (1) on the venturi assembly (2) to start a vacuum draw.

Fig. 42: Coolant Extraction Hose

Courtesy of GENERAL MOTORS COMPANY

27. Use the extraction hose (1) to draw out coolant to the proper level.
28. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

COOLANT TEMPERATURE SENSOR REPLACEMENT

Removal Procedure

WARNING: Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the cooling system. **Drive Motor Generator Power Inverter Module Cooling System Draining**

and Filling

3. Remove [Front Bumper Fascia Center Support Replacement](#)
4. Remove [Pedestrian Sound Alert Speaker Replacement](#)

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Component Fastener Tightening Caution](#) .

1. Install the coolant temperature sensor (2) and tighten to 33 N.m (24 lb ft).
2. Connect Electrical Connector (1)

3. Install [Front Bumper Fascia Center Support Replacement](#)
4. Install [Pedestrian Sound Alert Speaker Replacement](#)
5. Fill the cooling system. [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT

Removal Procedure

WARNING: Ensure all High Voltage safety procedures are followed. Failure to follow the procedure exactly as written may result in serious injury or death.

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove [High Voltage Battery Cover Replacement](#)
2. Remove [High Voltage Battery Disconnect Relay Replacement](#)

Fig. 45: Electrical Connector And Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect Electrical Connector(1).
4. Loosen Clamp(2).

5. Remove Engine Coolant Temperature Sensor(3).

Installation Procedure

Fig. 46: Electrical Connector And Engine Coolant Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

1. Install Engine Coolant Temperature Sensor(3).
2. Install Clamp(2).
3. Connect Electrical Connector(1).
4. Install [High Voltage Battery Disconnect Relay Replacement](#)
5. Install [High Voltage Battery Cover Replacement](#)

DRIVE MOTOR CONTROL MODULE RADIATOR INLET HOSE REPLACEMENT

Removal Procedure

WARNING: Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

1. Routing and the fixations of the drive motor generator control module cooling outlet hose (1) without the engine.

Removal Procedure

WARNING: Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

2. Drain the cooling system. **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**

HIGH VOLTAGE BATTERY HEATER REPLACEMENT

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

1. Remove [High Voltage Battery Cover Replacement](#)
2. Remove [High Voltage Battery Disconnect Relay Replacement](#)

Fig. 114: Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connectors.(1, 6)
4. Remove the high voltage battery heater ground cable bolt (5).
5. Hang the high voltage battery heater ground cable (4) aside.
6. Use a paint pen and place match marks on the high voltage battery heater (2) and the drive motor battery wire junction block relay (3) to ensure proper realignment during installation.

Fig. 115: High Voltage Battery Heater And High Voltage Heater Outlet Hose Fitting

Courtesy of GENERAL MOTORS COMPANY

7. Remove High Voltage Heater Outlet Hose Fitting(4)
8. Remove High Voltage Battery Heater(1)
9. Remove and DISCARD the 2 heater outlet hose fitting O-ring seals (2, 3)

Installation Procedure

Fig. 116: High Voltage Battery Heater And High Voltage Heater Outlet Hose Fitting
Courtesy of GENERAL MOTORS COMPANY

1. Install the 2 NEW heater outlet hose fitting O-ring seals (2, 3)
2. Position the high voltage battery heater (1) to the drive motor battery wire junction block relay ensuring to align the match marks.
3. Install High Voltage Heater Outlet Hose Fitting(4)

CAUTION: Fastener Caution

NOTE: **Ensure that the high voltage battery heater (1) is correctly aligned.**

4. Hold the high voltage battery heater (1) and tighten the heater outlet hose fitting (4) to 45 N.m (33 lb ft).

Fig. 117: Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

5. Reposition the high voltage battery heater ground cable (4) to the high voltage battery heater (1).
6. Install the high voltage battery heater ground cable bolt (5).

7. Connect the electrical connectors.(1, 6)
8. Install [High Voltage Battery Disconnect Relay Replacement](#)
9. Install [High Voltage Battery Cover Replacement](#)

DRIVE MOTOR BATTERY RADIATOR SURGE TANK CAP REPLACEMENT

WARNING: Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

NOTE: The tamper-resistant coolant cap has a one-way mechanism to deter the service of cooling systems by unqualified individuals.

Removal Procedure

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.

Fig. 118: Cap Cover And Cap Body

Courtesy of GENERAL MOTORS COMPANY

2. Rotate the cap upper cover counter-clockwise to align the slot in the cap cover (1) with the slot in the cap body (2).

Fig. 119: Flat Bladed Screwdriver And Slot
Courtesy of GENERAL MOTORS COMPANY

3. Insert a flat bladed screwdriver (1) into the slot (2), no wider than 8 mm (5/16").

NOTE: Do not use the flat bladed screwdriver to loosen the cap.

4. With the cap sections engaged, rotate the cap counter-clockwise by hand to loosen and remove from the surge tank.

Installation Procedure

1. Install and rotate cap clockwise until it is tight, and the detent in cap engages to the rib in the surge tank.

Removal Procedure

WARNING: Before conducting any repair to this high voltage cooling system, it is necessary to determine/verify whether no high-voltage system faults exist. If high-voltage faults exist, follow published DTC diagnostics/repair procedures prior to performing any cooling system repairs. Failure to correct High Voltage Faults before working on the high voltage cooling system could result in personal injury or death.

WARNING: Do not use a service jack in locations other than those specified to lift this vehicle. Lifting the vehicle with a jack in those other locations could cause the vehicle to slip off the jack and roll; this could cause injury or death.

1. Turn the Vehicle Power Off, remove all keyless entry transmitters from the vehicle and secure in a place outside the vehicle.
2. Drain the cooling system. [Drive Motor Battery Cooling System Draining and Filling](#)
3. Raise and support the vehicle. [Lifting and Jacking the Vehicle](#)

HIGH VOLTAGE BATTERY COOLING MANIFOLD INLET HOSE REPLACEMENT (JUNCTION BLOCK TO SECTION 1)

Removal Procedure

WARNING: Before working on any high voltage system, be sure to wear the following

Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

DESCRIPTION AND OPERATION

HYBRID/EV COOLING SYSTEM DESCRIPTION AND OPERATION

This vehicle is equipped with three fully independent cooling systems.

1. The hybrid/EV electronics cooling system is dedicated to cooling the following components:
 - 14V accessory power module
 - battery charger
 - drive motor generator power inverter module
2. The hybrid/EV battery pack cooling system is dedicated to cooling and heating the high voltage hybrid/EV battery.
3. The engine cooling system is dedicated to:
 - cooling the engine
 - providing heat to the passenger compartment

Hybrid Electronics Cooling System Description and Operation

Fig. 194: Hybrid Electronics Cooling System Components

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Electronics Coolant Reservoir
2	Drive Motor Generator Power Inverter Module
3	Transmission Coolant Inlet and Outlet Ports
4	Battery Charger
5	14 V Accessory Power Module
6	12 V Hybrid/EV Coolant Pump
7	Hybrid/EV Radiator

The primary purpose of the hybrid/EV electronics cooling loop is to cool the drive motor generator power inverter module, battery charger, and the 14V accessory power module. The hybrid/EV electronics cooling system uses the hybrid/EV electronics radiator, engine control module inputs, two 12 V pulse width modulated (PWM) radiator fans and a 12 V hybrid/EV electronics coolant pump to circulate coolant through the system. The hybrid/EV powertrain control module 2 activates the hybrid/EV electronics coolant pump and monitors a temperature sensor in the hybrid/EV electronics radiator. The hybrid/EV electronics coolant pump will be activated when the vehicle is on and during charging.

The hybrid/EV electronics cooling system circulates a pre-mixed DEX-COOLÂ® which is a 50/50 mixture of DEX-COOLÂ® and de-ionized water. De-ionized water is required for high voltage isolation and to prevent corrosion from effecting heat sink performance. Always use pre-mixed coolant and never use tap water in the hybrid/EV electronics coolant system.

Hybrid/EV Battery Pack Cooling System Description and Operation

Fig. 195: Hybrid/EV Battery Pack Cooling System Components
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Coolant Surge Tank
2	12 V Hybrid/EV Battery Pack Coolant Pump
3	A/C Compressor
4	Refrigerant/Coolant Heat Exchanger
5	Hybrid/EV Battery Coolant Inlet
6	Hybrid/EV Battery Coolant Outlet

The energy storage system cooling system uses a 12 V hybrid/EV battery pack coolant pump, a refrigerant/coolant heat exchanger (chiller) and the electric A/C compressor motor control module assembly to cool down the high voltage hybrid/EV battery. There is also a high voltage heater inside the hybrid/EV battery to heat the coolant entering the hybrid/EV battery when needed. The hybrid/EV powertrain control module 2 monitors the hybrid/EV battery coolant temperature, hybrid/EV battery cell temperature, refrigerant temperature, refrigerant pressure, and Coolant Level Sensor. The hybrid/EV powertrain control module 2 determines how much hybrid/EV battery cooling or heating is required and turns on the hybrid/EV battery pack coolant pump. Depending on what is required, it will operate the radiator fans and request the A/C Compressor Module to turn on the high voltage A/C compressor, or turn on the high voltage hybrid/EV battery pack heater.

The hybrid/EV battery pack cooling system could be activated when the vehicle is operating, during charging, or when the vehicle is OFF and maintaining the hybrid/EV battery pack temperature. Refer to [Automatic HVAC Description and Operation](#) .

The hybrid/EV battery pack coolant level sensor is attached to the coolant surge tank. The level sensor is a 2 state switch which changes state when the level in the surge tank gets low. The hybrid/EV powertrain control module 2 uses the hybrid/EV battery pack coolant level sensor to determine if disabling the hybrid/EV battery pack charging operation is necessary due to a loss of coolant.

The hybrid/EV battery pack cooling system circulates a pre-mixed DEX-COOLÂ® which is a 50/50 mixture of DEX-COOLÂ® and de-ionized water. De-ionized water is required for high voltage isolation and to prevent corrosion from effecting heat sink performance. Always use pre-mixed coolant and never use tap water in the battery coolant system.

Passenger Compartment Heater System Description and Operation

Fig. 196: Passenger Compartment Heater System Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Engine Coolant Surge Tank

Callout	Component Name
2	Check Valve
3	Engine Connection
4	High Voltage Heater Control Module
5	12 V Auxiliary Heater Coolant Pump
6	Passenger Compartment Heater Coolant Control Valve
7	Heater Core

The passenger compartment heater system uses the engine radiator, a 12 V auxiliary heater coolant pump, a passenger compartment heater coolant control valve, a high voltage coolant heater control module and a heater core.

The passenger compartment heater coolant control valve has two positions. When commanded in bypass mode, as when the engine is OFF, the passenger compartment heater coolant control valve separates the engine and the high voltage coolant heater control module coolant loops to prevent heat generated by the high voltage heater from dissipating into the engine coolant loop. After the engine starts up and has attained sufficient warmth, the passenger compartment heater coolant control valve is commanded to normal mode and the two coolant loops are linked. Linking allows excess engine heat to assist the high voltage coolant heater control module in heating the passenger compartment. The passenger compartment heater control valve contains an internal position sensor that the hybrid powertrain control module 2 monitors. When the engine coolant temperature heats up, a valve position learn procedure takes place.

The HVAC control module turns on the auxiliary heater coolant pump and monitors the temperature sensors in the passenger compartment and coolant loop to determine if high voltage coolant heater control module operation is needed. Passenger compartment heat is provided by air flowing through the heater core. When operating the vehicle in cold temperatures, the engine may run for short periods to assist in maximizing heat efficiency to the passenger compartment depending on the outside temperature and the amount of passenger compartment heat requested by the vehicle operator.

The hybrid/EV powertrain control module 2 will command the passenger compartment heater coolant control valve into bypass mode when the module goes to sleep, at controller wake-up, and during other times except:

- During learn, after extended loss of 12 V power to the controller
- When the scan tool is sending a command.
- If the valve is stuck in an intermediate position, between two end positions, due to failure or debris.

The engine/passenger compartment heater cooling system circulates a 50/50 mixture of DEX-COOLÂ® and deionized water.

Radiator Cooling Fan Operation

The hybrid/EV powertrain control module 2 indirectly controls the radiator fans. The engine control module processes all requests for the cooling fans to be turned ON regardless of which module originates the request. The engine control module decides if and at what speed the cooling fans should operate. The engine control module sends the cooling fan command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the signal to the cooling fans to operate and at what speed. The hybrid/EV electronics coolant pump and radiator cooling fans may also be enabled during an after-run event, determined by coolant loop temperature.

If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate and the engine control module is not awake, the hybrid/EV powertrain control module 2 will control the

cooling fans. If active cooling of the Hybrid/EV Battery Pack is needed, the engine control module wakes up to operate the air conditioning control module and then the engine control module is the master controller for the fans.

Illustration	Tool Number/ Description
 A 3D illustration of a pair of blue hose clamp pliers. The tool consists of two long, tapered handles that meet at a central pivot point. The handles are made of a solid material, likely metal or high-strength plastic, and have a smooth, slightly curved surface. The jaws of the pliers are located at the ends of the handles, near the pivot. They are designed with a specific shape to grip and manipulate hose clamps. The entire tool is rendered in a uniform blue color with some shading to give it a three-dimensional appearance.	BO 38185 J 38185 Hose Clamp Pliers

B32B	Hybrid/EV Battery Temperature Sensor 2	-	Under the vehicle, in the Hybrid/EV battery section 3, part of Hybrid/EV battery module 3	<u>Underbody - Hybrid/EV Battery Pack Internals</u>	<u>B32B Hybrid/EV Battery Temperature Sensor 2</u>
B32C	Hybrid/EV Battery Temperature Sensor 3	-	Under the vehicle, in the Hybrid/EV battery section 2, part of Hybrid/EV battery module 4	<u>Underbody - Hybrid/EV Battery Pack Internals</u>	<u>B32C Hybrid/EV Battery Temperature Sensor 3</u>
B32D	Hybrid/EV Battery Temperature Sensor 4	-	Under the vehicle, in the Hybrid/EV battery section 2, part of Hybrid/EV battery module 5	<u>Underbody - Hybrid/EV Battery Pack Internals</u>	<u>B32D Hybrid/EV Battery Temperature Sensor 4</u>
B32E	Hybrid/EV Battery Temperature Sensor 5	-	Under the vehicle, in the Hybrid/EV battery section 1, part of Hybrid/EV battery module 6	<u>Underbody - Hybrid/EV Battery Pack Internals</u>	<u>B32E Hybrid/EV Battery Temperature Sensor 5</u>
B32F	Hybrid/EV Battery Temperature Sensor 6	-	Under the vehicle, in the Hybrid/EV battery section 1, part of Hybrid/EV battery module 7	<u>Underbody - Hybrid/EV Battery Pack Internals</u>	<u>B32F Hybrid/EV Battery Temperature Sensor 6</u>
B34	Engine Coolant Temperature Sensor	-	In the engine compartment, at the left end of the cylinder head, mounted	<u>Left Rear of Engine Components</u>	<u>B34 Engine Coolant Temperature Sensor</u>

Code	Name	Option	Location	Locator View	Connector End View
			in the coolant outlet housing		
B37B	Engine Oil Pressure Sensor	-	In the rear of the engine, below the high pressure fuel pump	<u>Left Rear of Engine Components</u>	<u>B37B Engine Oil Pressure Sensor</u>
B46	Fuel Level Sensor	-	Under the vehicle, in the fuel tank, part of the fuel pump and level sensor assembly	-	-
B47	Fuel Pressure Sensor	-	Under the vehicle, at the right of the fuel tank, in the fuel feed line	<u>Underbody - Fuel System Components (2 of 2)</u>	<u>B47 Fuel Pressure Sensor</u>
B52A	Heated Oxygen Sensor 1	-	In the front of the engine compartment, at the top of the catalytic converter	<u>Right Front of Engine Components (2 of 2)</u>	<u>B52A Heated Oxygen Sensor 1</u>
B52B	Heated Oxygen Sensor 2	-	In the front of the engine compartment, in the exhaust pipe, downstream of the catalytic converter	<u>Right Front of Engine Components (2 of 2)</u>	<u>B52B Heated Oxygen Sensor 2</u>
B55	Hood Ajar Switch	-	At the front center of the vehicle, part of the hood latch	<u>Engine Compartment Components - Front (3 of 4)</u>	<u>B55 Engine Hood Switch</u>
B59L	Front Impact Sensor - Left	-	At the front of the vehicle, mounted to the top left of the radiator core support	<u>Front of Vehicle Components (2 of 2)</u>	<u>B59L Front Impact Sensor - Left</u>
B59R	Front Impact Sensor - Right	-	At the front of the vehicle, mounted to the top right of the	<u>Front of Vehicle Components (2 of 2)</u>	<u>B59R Front Impact Sensor - Right</u>

Code	Name	Option	Location	Locator View	Connector End View
			radiator core support		
B63LF	Side Impact Sensor - Left Front	-	In the passenger compartment, in the center of the left front door	<u>Driver Door Components</u>	<u>B63LF Side Impact Sensor - Left Front</u>
B63LR	Side Impact Sensor - Left Rear	-	In the passenger compartment, in the center of the left rear door	<u>Rear Seat Components (2 of 3)</u>	<u>B63LR Side Impact Sensor - Left Rear</u>
B63RF	Side Impact Sensor - Right Front	-	In the passenger compartment, in the center of the right front door	<u>Passenger Door Components</u>	<u>B63RF Side Impact Sensor - Right Front</u>
B63RR	Side Impact Sensor - Right Rear	-	In the passenger compartment, in the center of the right rear door	<u>Rear Seat Components (3 of 3)</u>	<u>B63RR Side Impact Sensor - Right Rear</u>
B68	Knock Sensor	-	In the engine compartment, at the rear of the engine block, in the center, under the intake manifold	<u>Left Front of Engine Components</u>	<u>B68 Knock Sensor</u>
B74	Manifold Absolute Pressure Sensor	-	In the engine compartment, mounted in the left side of the intake manifold	• <u>Left Rear of Engine Components</u> • <u>Left Rear of Engine/Transmission Components</u>	<u>B74 Manifold Absolute Pressure Sensor</u>
B75C	Multifunction Intake Air Sensor	-	At the right rear of the engine, in the intake air snorkel	<u>Right Front of Engine Components (1 of 2)</u>	<u>B75C Multifunction Intake Air Sensor</u>
B81B	Park Position Switch	-	In the passenger compartment, part of the automatic transmission shift lever assembly	-	<u>B81B Park Position Switch</u>
B87	Rearview Camera	UVC	At the rear of the vehicle, between the license plate	<u>Rear of Vehicle Components (2 of 3)</u>	<u>B87 Rearview Camera</u>

Code	Name	Option	Location	Locator View	Connector End View
			lamps, in the center of the fascia		
B88D	Seat Belt Switch - Driver	-	In the passenger compartment, part of the driver seat belt buckle	-	<u>B88D Seat Belt Switch - Driver</u>
B88P	Seat Belt Switch - Passenger	-	In the passenger compartment, part of the passenger seat belt buckle	-	<u>B88P Seat Belt Switch - Passenger</u>
B101	Immobilizer Antenna	-	In the passenger compartment, behind the center of the instrument panel, above the HVAC control module, part of the immobilizer control module	-	-
B107	Accelerator Pedal Position Sensor	-	In the passenger compartment, under the driver side of the instrument panel, part of the accelerator pedal	<u>Instrument Panel Components (4 of 4)</u>	<u>B107 Accelerator Pedal Position Sensor</u>
B118B	Windshield Washer Fluid Level Switch	-	At the left front of the vehicle, behind the left side of the fascia, in the bottom washer solvent bottle	<u>Right Front of Vehicle Components</u>	<u>B118B Windshield Washer Fluid Level Switch</u>
B130A	Exhaust Gas Recirculation Temperature Sensor 1	-	On the right front top of the engine, on the EGR valve	<u>Right Front of Engine Components (2 of 2)</u>	<u>B130A Exhaust Gas Recirculation Temperature Sensor 1</u>
B130B	Exhaust Gas Recirculation Temperature Sensor 2	-	On the engine, behind the left front side of the exhaust	<u>Right Front of Engine Components (2 of 2)</u>	<u>B130B Exhaust Gas Recirculation Temperature Sensor 2</u>

Code	Name	Option	Location	Locator View	Connector End View
			manifold, near cylinder 4		
B150	Fuel Tank Pressure Sensor	-	Under the vehicle, rear of the fuel tank, mounted on the evaporative emission canister	-	<u>B150 Fuel Tank Pressure Sensor</u>
B153D	Seat Belt Buckle - Driver	-	In the passenger compartment, on the inboard side of the driver seat	-	-
B153P	Seat Belt Buckle - Passenger	-	In the passenger compartment, on the inboard side of the passenger seat	-	-
B160	Windshield Temperature and Inside Moisture Sensor	-	In the passenger compartment, at the top center of the windshield	<u>Headliner Components (3 of 4)</u>	<u>B160 Windshield Temperature and Inside Moisture Sensor</u>
B197	Charge Port Door Position Switch	-	At the left front of the vehicle, behind the rear of the left front fender	<u>Left Front of Vehicle Components (2 of 2)</u>	<u>B197 Charge Port Door Position Switch</u>
B201	Brake Control Brake Pedal Position Sensor	-	In the engine compartment, below the master cylinder	<u>Engine Compartment Components - Left</u>	<u>B201 Brake Control Brake Pedal Position Sensor</u>
B202	Hybrid/EV Electronics Coolant Temperature Sensor	-	At the right front of the engine compartment, mounted in the top right of the Hybrid/EV electronics radiator	<u>Engine Compartment Components - Front (2 of 4)</u>	<u>B202 Hybrid/EV Electronics Coolant Temperature Sensor</u>
B203	Radiator Coolant Temperature Sensor	-	At the right front of the engine compartment, mounted in the	<u>Engine Compartment Components - Front (2 of 4)</u>	<u>B203 Engine Coolant Radiator Temperature Sensor</u>

Code	Name	Option	Location	Locator View	Connector End View
			right center of the engine radiator side tank		
B204A	Hybrid/EV Battery Pack Coolant Temperature Sensor 1	-	Under the vehicle, inside the hybrid/EV battery pack, in the coolant inlet tube	-	<u>B204A Hybrid/EV Battery Pack Coolant Temperature Sensor 1</u>
B208	Fuel Fill Door Status Switch Assembly	-	At the right rear of the vehicle, behind the right rear quarter panel	<u>Underbody - Fuel System Components (1 of 2)</u>	<u>B208 Fuel Fill Door Status Switch Assembly</u>
B218L	Side Object Sensor Module - Left	UFG	At the right rear of the vehicle, behind the rear fascia	<u>Rear of Vehicle Components (2 of 3)</u>	<u>B218L Side Object Sensor Module - Left</u>
B218R	Side Object Sensor Module - Right	UFG	At the left rear of the vehicle, behind the rear fascia	<u>Rear of Vehicle Components (2 of 3)</u>	<u>B218R Side Object Sensor Module - Right</u>
B228A	Drive Motor 1 Position Sensor	-	In the engine compartment, internal to the automatic transmission, part of drive motor 1	<u>Transmission Components</u>	<u>B228A Drive Motor 1 Position Sensor</u>
B228B	Drive Motor 2 Position Sensor	-	In the engine compartment, internal to the automatic transmission, part of drive motor 2	<u>Transmission Components</u>	<u>B228B Drive Motor 2 Position Sensor</u>
B233B	Radar Sensor Module - Long Range	UGN	In the engine compartment, behind the grill, next to the left headlamp assembly	-	<u>B233B Radar Sensor Module - Long Range</u>
B258	Hybrid/EV Battery Coolant Level Switch	-	In the front middle of the engine	<u>Engine Compartment Components - Front (1 of 4)</u>	<u>B258 Hybrid/EV Battery Coolant Level Switch</u>

Code	Name	Option	Location	Locator View	Connector End View
			compartment, in the Hybrid/EV Battery Coolant Surge Tank		
B284	Vehicle Dynamic Sensor	-	In the passenger compartment, under the center console, at the rear	<u>Passenger Compartment Components (3 of 3)</u>	<u>B284 Vehicle Dynamic Sensor</u>
B305	Ambient Light/Sunload Sensor and Battery State of Charge Indicator	-	In the passenger compartment, at the top center of the instrument panel, in the windshield defog vent	<u>Instrument Panel Components (1 of 4)</u>	<u>B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator</u>
B306A	Parking Assist Sensor - Front Left Outer	UFQ	At the front of the vehicle, mounted in the front fascia	<u>Front of Vehicle Components (1 of 2)</u>	<u>B306A Parking Assist Sensor - Front Left Outer</u>
B306B	Parking Assist Sensor - Front Left Middle	UFQ	At the front of the vehicle, mounted in the front fascia	<u>Front of Vehicle Components (1 of 2)</u>	<u>B306B Parking Assist Sensor - Front Left Middle</u>
B306C	Parking Assist Sensor - Front Right Middle	UFQ	At the front of the vehicle, mounted in the front fascia	<u>Front of Vehicle Components (1 of 2)</u>	<u>B306C Parking Assist Sensor - Front Right Middle</u>
B306D	Parking Assist Sensor - Front Right Outer	UFQ	At the front of the vehicle, mounted in the front fascia	<u>Front of Vehicle Components (1 of 2)</u>	<u>B306D Parking Assist Sensor - Front Right Outer</u>
B306E	Parking Assist Sensor - Rear Left Outer	UD7	At the rear of the vehicle, mounted in the rear fascia	<u>Rear of Vehicle Components (2 of 3)</u>	<u>B306E Parking Assist Sensor - Rear Left Outer</u>
B306F	Parking Assist Sensor - Rear Left Middle	UD7	At the rear of the vehicle, mounted in the rear fascia	<u>Rear of Vehicle Components (2 of 3)</u>	<u>B306F Parking Assist Sensor - Rear Left Middle</u>

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0CF4-P0CF6: CONTROL PILOT CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0CF4

Control Pilot Circuit Performance

DTC P0CF5

Control Pilot Circuit Low Voltage

DTC P0CF6

Control Pilot Circuit High Voltage

Diagnostic Fault Information

110/120 A/C Ground	-	P0D59, 1	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors a pilot signal from the drive motor battery charger cable. The hybrid/EV powertrain control module 2 utilizes this signal to manage the charging process between the drive motor battery charger cable and the hybrid/EV powertrain control module 2.

Under normal charging conditions the control pilot signal is generated by the drive motor battery charger cable. This diagnostic runs with the drive motor battery charger cable disconnected to verify the vehicle side circuit integrity. The diagnostic signal is generated internally by the hybrid/EV powertrain control module 2.

Conditions for Running the DTC

DTC P0CF4

- The vehicle 12 V battery system voltage is 10.2 V or greater.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- The vehicle needs to be driven above 8 km/h (5 mph).

DTC P0CF5

- The vehicle 12 V battery system voltage is 10.2 V or greater.
- The drive motor battery charger cable is disconnected and the charge port door is closed.

DTC P0CF6

- The vehicle 12 V battery system voltage is 10.2 V or greater.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- The vehicle needs to be driven above 8 km/h (5 mph).

Conditions for Setting the DTC

DTC P0CF4

The control pilot circuit is not meeting its internal range requirements for 5 seconds. This can only be set internal to the hybrid/EV powertrain control module 2. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

DTC P0CF5

The control pilot circuit voltage divided by the system voltage is less than 0.03 V for 5 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

DTC P0CF6

The control pilot circuit voltage divided by the system voltage is greater than 0.55 V for 5 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

Actions Taken When the DTC Sets

- DTC P0CF4-P0CF6 are type A DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0CF4-P0CF6 are type A DTCs.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to [High Voltage Disabling](#) .
Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

Fig. 4: Hybrid/EV Battery Charger Receptacle And Terminals
 Courtesy of GENERAL MOTORS COMPANY

NOTE: The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.

2. Test for infinite resistance between control pilot signal circuit terminal 2 of the X98 Hybrid/EV Battery Charger Receptacle and the terminals listed below:

- Terminal 4
- Terminal 1
- Terminal 5
- Terminal 3
- **If less than infinite resistance**

1. Disconnect the harness connector from the X98 Hybrid/EV Battery Charger Receptacle.

NOTE: This test is performed on the vehicle side of the harness connector.

2. Test for infinite resistance between the harness connector control pilot signal circuit terminal 2 and the terminals listed below:

- Terminal 4
- Terminal 1
- Terminal 5
- Terminal 3
- If less than infinite resistance, repair the short between the circuits.
- If infinite resistance, replace the X98 Hybrid/EV Battery Charger Receptacle.
- **If infinite resistance**

3. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Drive Motor Battery Charger Receptacle Replacement**

- [Control Module References](#) for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0CF9 OR P0D01: CONTROL PILOT CHARGING SWITCH PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0CF9

Control Pilot Charging Switch Performance

DTC P0D01

Control Pilot Charging Ventilation Switch Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control Pilot Signal	P0CF4, P0CF5, P0CF6, P0CF9, P0D01, 1	P0CF4, P0CF5, P0CF6, 1	P0CF4, P0CF5, P0CF6, P0CF9, 1	P0CF4, P0CF5, P0CF6, 1

1. Plug In Charging Malfunction				

Circuit/System Description

The hybrid/EV powertrain control module 2 has two internal switches used to modify the control pilot signal. The first internal switch modifies the control pilot signal to indicate to the drive motor battery charger cable that the vehicle is either ready or not ready to accept energy. The second internal switch modifies the control pilot signal to indicate to some drive motor battery charger cables (currently not used) if indoor ventilation is required.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The drive motor battery charger cable is disconnected and the charge port door is closed.
- The diagnostics for DTC P0CF4-P0CF6 must have passed before these will run.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 measures a pilot signal voltage out of range for 5 seconds. This is an internal circuit voltage in the hybrid/EV powertrain control module 2 and can not be measured.

Actions Taken When the DTC Sets

- DTC P0CF9 and P0D01 are type A DTCs
- Disables the high voltage battery charging.

Conditions for Clearing the DTC

DTC P0CF9 and P0D01 are type A DTCs.

Circuit/System Verification

1. Vehicle ON.
2. Verify that DTC P0CF9 or P0D01 is not set.
 - **If either of the DTCs are set**
 Replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If none of the DTCs are set**
3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0D1F: CONTROL MODULE DATE/TIME SYNCHRONIZATION PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D1F

Control Module Date/Time Synchronization Performance

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the date and time data it receives from the radio. This time information is used to ensure the module's internal clock is synchronized to the customer's local time. The Time of Day Charging feature utilizes this internal clock to keep track of time and alarms for delayed charging modes. If this radio time data is received during a drive cycle, the system is considered synchronized.

Conditions for Running the DTC

The vehicle needs to go from Vehicle OFF to Vehicle in Service Mode to start the diagnostic.

Conditions for Setting the DTC

The vehicle is driven for more than 5 consecutive drive cycles where trip distance exceeds 15 Km (9.3 mi), and the date and time were unavailable from the OnStar Module.

Actions Taken When the DTC Sets

- DTC P0D1F is a type C DTC.
- On the Navigation screen "Default Charge Mode: Immediately" is displayed.
- The battery charger Time Of Day charging option is disabled, and charging mode is set to IMMEDIATE.

Conditions for Clearing the DTC

DTC P0D1F is a type C DTCs.

DTC P0D26: BATTERY CHARGER SYSTEM PRECHARGE TIME TOO LONG

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D26

Battery Charger System Precharge Time Too Long

Circuit/System Description

In order to prevent large in-rush current, battery charger bus high voltage is routed through a pre-charge resistor whenever high voltage charging is commanded ON. The hybrid/EV powertrain control module 2 monitors the time it takes the battery charger bus voltage to attain the same level as the battery pack voltage. If it takes too long, a DTC is set.

Conditions for Running the DTC

- Battery charger must go from disconnected to connected.
- Drive motor battery charger cable must be connected and vehicle receiving power.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 determines the battery charger does not reach its pre-charge voltage within 1 second.

Actions Taken When the DTC Sets

- DTC P0D26 is a Type A DTC.
- Disables the high voltage battery charging.
- Disables 12V battery charging.

Conditions for Clearing the DTC

DTC P0D26 is a Type A DTC.

Circuit/System Verification

1. Verify DTC P0C78 is not set.

- **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If the DTC is not set**

2. Verify DTC P0CF4, P0CF5, P0CF6, P0D4E, P0D4F, P0D58, or P0D59 is not set.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**

3. Connect the drive motor battery charger cable. Verify DTC P0D26 is not set and the vehicle will charge.

- **If the DTC is set and the vehicle will not charge**

Refer to Circuit/System Testing.

- **If the DTC is not set and the vehicle charges**

4. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage for servicing at the A4 Battery Pack, K1 14V Power Module and the T18 Battery Charger. Refer to [High Voltage Disabling](#) .
2. Disconnect the X3 connector at the T18 Battery Charger, the X4 connector at the K1 14V Power Module and the X6 connector at the A4 Battery Pack.
3. Verify that all HV harness connector and mating module connector terminals are free from moisture, corrosion and arc flash damage.
 - **If any terminals show signs of damage**

Replace the HV wiring harness and effected modules as necessary.

- **If no arc flash damage, moisture, or corrosion is found**

4. Test the following HV harness terminals for less than 2 Ω end to end:

- X6-1 to X3-1

- X6-1 to X4-B
- X6-2 to X3-2
- X6-2 to X4-A
- **If 2 Ω or greater**

Replace the HV wiring harness.

- **If less than 2 Ω**

5. Remove the T18 Battery Charger 15A fuse from the A4 Battery Pack. Refer to [High Voltage Battery Disconnect Relay Fuse Replacement \(Front - BDU\)](#) [High Voltage Battery Disconnect Relay Fuse Replacement \(Rear - BDU\)](#) for Front-BDU.

6. Test the battery charger 15A fuse for an open condition.

- **If the fuse is open**

NOTE: The HV harness must remain disconnected from all modules.

1. Test the HV harness terminals X6-1 to X6-2 for infinite resistance.

- If less than infinite resistance, replace the fuse and the HV wiring harness.
- If infinite resistance

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value.

2. Test the K1 14 V Power Module X4 terminals for greater than 10K Ω , X4-A to X4-B.

- If 10K Ω or less, replace the K1 14V Power Module and the fuse.
- If greater than 10 K Ω

NOTE: This test is performed at the module terminals with the test measurement initially several Meg ohms and slowly decreasing to a minimal value.

3. Test the T18 Battery Charger terminals for greater than 10K Ω , X3-1 to X3-2.

- If 10K Ω or less, replace the T18 Battery Charger and the fuse.
- If greater than 10 K Ω

4. Replace the T18 Battery Charger and the fuse, reassemble the vehicle, clear DTCs and repeat Circuit/System Verification.

- If Circuit/System Verification is not OK, replace the A28 Hybrid/EV Battery Contactor Assembly.
- If Circuit/System Verification is OK, all OK.

- **If the fuse is OK**

7. Reinstall the fuse. Replace the T18 Battery Charger, reassemble the vehicle, clear DTCs and repeat Circuit/System Verification.

- **If Circuit/System Verification is not OK**

Replace the A28 Hybrid/EV Battery Contactor Assembly.

- **If Circuit/System Verification is OK**

8. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Charger Receptacle, Accessory DC Power Control Module, and Drive Motor Battery Charger](#) for HV wiring harness
- [Generator Battery Disconnecter Relay Replacement](#) for A28 hybrid/EV battery contactor assembly
- [Control Module References](#) for T18 Battery Charger, often referred to as the Drive Motor Battery Charger, or K1 14V Power Module replacement, programming and setup

DTC P0D2B OR P0D2C: CONTROL PILOT/STATUS INDICATOR CONTROL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D2B

Control Pilot Indicator Control Circuit

DTC P0D2C

Charge Status Indicator Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Charge Pilot Indicator Control	P0D2B	P0D2B	P0D2B	-
Charge Status Indicator Control	P0D2C	P0D2C, 1	P0D2C	-
Charge Complete Indicator Control	1	1	1	-
Low Reference	-	P0D2C, P0D2B	-	-
1. Plug In Charging Indicator Malfunction				

Circuit/System Description

The status of charging events (including delays) is communicated to the user through a charge status indicator and audio tones. The battery state of charge indicator, located on the top middle of the instrument panel, will be solid lit green when the vehicle is charging under automatic control. It will have a fast flash green if the charging is delayed and will begin later. It will have a slow flash green when charging is complete. A solid lit yellow indicator means the vehicle is not able to accept a charge. And if there is no indicator lit it means the electronic vehicle supply equipment is not working properly or connected.

Conditions for Running the DTC

Both conditions need to run for diagnostic to pass.

Condition 1

- The 12 V battery voltage is greater than 10.2 V.
- Vehicle in Service Mode.
- The drive motor battery charger cable is disconnected (charge status indicator commanded OFF).

Condition 2

- The 12 V battery voltage is greater than 10.2 V.
- Vehicle in Service Mode.
- The vehicle is connected to an AC supply and the battery charger is charging the vehicle (charge status indicator commanded ON).

Conditions for Setting the DTC

- Charge status indicator Commanded OFF, The hybrid/EV powertrain control module 2 detects a short to battery for about 4 s.
- Charge status indicator Commanded ON, The hybrid/EV powertrain control module 2 detects a short to ground or an open/high resistance for 4 s.

Actions Taken When the DTC Sets

DTC P0D2B and P0D2C are type C DTCs.

Conditions for Clearing the DTC

DTC P0D2B and P0D2C are type C DTCs.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disconnect the X1 harness connector at the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.
2. Test for less than 10 Ω between the low reference terminal 1 and ground.

- If 10 Ω or greater

Repair the open/high resistance in the circuit.

- If less than 10 Ω

NOTE: If the drive motor battery charger cable is connected. The drive motor battery charger cable must be disconnected for more than 10 seconds before performing the next step.

3. Connect a test lamp between the control circuit terminal 4 and ground.
4. Verify the test lamp does not illuminate.

- If the test lamp does illuminate

1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp does not illuminate**
5. Connect the drive motor battery charger cable.
 6. Verify that the test lamp illuminates within the first 5 seconds of connecting the drive motor battery charger cable.
 - **If the test lamp does not illuminate**
 1. Disconnect the drive motor battery charger cable. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the control circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp does illuminate**
 7. Disconnect the drive motor battery charger cable for at least 10 seconds. Connect a test lamp between the control circuit terminal 3 and ground.
 8. Verify the test lamp does not illuminate.
 - **If the test lamp does illuminate**
 1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp does not illuminate**
 9. Connect the drive motor battery charger cable.
 10. Verify that the test lamp illuminates within 25 seconds of connecting the drive motor battery charger cable.
 - **If the test lamp does not illuminate**
 1. Disconnect the drive motor battery charger cable. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the control circuit and ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp does illuminate**
 11. Replace the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.

Repair Instructions

DTC P0D3E-P0D40: BATTERY CHARGER INPUT VOLTAGE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D3E

Battery Charger Input Voltage Sensor Performance

DTC P0D3F

Battery Charger Input Voltage Sensor Circuit Low Voltage

DTC P0D40

Battery Charger Input Voltage Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the AC voltage sensor inside the battery charger. The signal is pulse-width modulated and the duty cycle increases as the AC voltage increases. The duty cycle equals 10% when the AC voltage sensor reports less than 60 V. The duty cycle equals 90% when the AC voltage sensor reports more than 280 V. Therefore, during normal operation the duty cycle is between 10% and 90%.

Conditions for Running the DTC

P0D3E

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle is driven above 6 km/h (4 mph).

P0D3F and P0D40

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle is connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

DTC P0D3E

The battery charger AC input duty cycle is greater than 12% or less than 8%.

DTC P0D3F

The battery charger AC input duty cycle is between 1% and 8%.

OR

The battery charger AC input duty cycle equals 100%.

DTC P0D40

The battery charger AC input duty cycle is between 92% and 99%.

OR

The battery charger AC input duty cycle equals 0%.

Actions Taken When the DTC Sets

- DTC P0D3E, P0D3F and P0D40 are type B DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0D3E, P0D3F and P0D40 are type B DTCs.

Circuit/System Verification

1. Drive the vehicle above 6 km/h (4 mph).
2. Vehicle OFF. Connect the vehicle to an AC supply to begin charging.
3. Vehicle in Service Mode.
4. Verify that P0D3E, P0D3F, or P0D40 is not set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.

- **If none of the DTCs are set**

5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the T18 Battery Charger. Vehicle in Service Mode.
2. Verify the scan tool High Voltage Battery Charger AC Input Duty Cycle parameter is less than 10%.
 - **If 10% or greater**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for infinite resistance between the AC voltage sensor circuit terminal 10 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If less than 10%**
3. Install a 3 A fused jumper wire between the AC voltage sensor circuit terminal 10 and the ground circuit terminal 2.
4. Verify the scan tool Battery Charger AC Input Status Duty Cycle parameter is greater than 90%.
 - **If 90% or less**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Vehicle in Service Mode.
 2. Test for less than 1 V between the AC voltage sensor circuit terminal 10 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Vehicle OFF.
 4. Test for less than 2 Ω in the AC voltage sensor circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 90%**
5. Replace the T18 Battery Charger.

DTC P0D4D-P0D4F: BATTERY CHARGER HYBRID/EV BATTERY OUTPUT VOLTAGE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC P0D4D

Battery Charger Hybrid/EV Battery Output Voltage Sensor Performance

DTC P0D4E

Battery Charger Hybrid/EV Battery Output Voltage Sensor Circuit Low Voltage

DTC P0D4F

Battery Charger Hybrid/EV Battery Output Voltage Sensor Circuit High Voltage

Circuit/System Description

The hybrid/EV powertrain control module 2 monitors the DC voltage sensor inside the battery charger. The signal is pulse-width modulated and the duty cycle increases as the DC voltage increases. The duty cycle equals 10% when the DC voltage sensor reports less than 0 V. The duty cycle equals 90% when the DC voltage sensor reports more than 500 V. Therefore, during normal operation the duty cycle is between 10% and 90%.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle is connected to an AC supply and the battery charger is charging the vehicle.

Conditions for Setting the DTC

DTC P0D4D

The difference between the battery charger DC output voltage and hybrid/EV battery DC input voltage is greater than 30 V.

DTC P0D4E

The battery charger DC output duty cycle is between 1% and 8%.

OR

The battery charger DC output duty cycle equals 100%.

DTC P0D4F

The battery charger DC output duty cycle is between 92% and 99%.

OR

The battery charger DC output duty cycle equals 0%.

Actions Taken When the DTC Sets

- DTC P0D4D, P0D4E and P0D4F are type B DTCs.
- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0D4D, P0D4E and P0D4F are type B DTCs.

Circuit/System Verification

1. Verify that DTC P0D4E or P0D4F is not set.
 - **If any of the DTCs are set**
Refer to Circuit/System Testing.
 - **If none of the DTCs are set**
2. Connect the vehicle to an AC supply to begin charging. Vehicle in Service Mode.
3. Verify that DTC P0D26 is not set.
 - **If the DTC is set**
Refer to DTC P0D26.
 - **If the DTC is not set**
4. Verify that DTC P0D4D is not set.
 - **If the DTC is set**
Refer to Circuit/System Testing.
 - **If the DTC is not set**
5. All OK.

Circuit/System Testing

NOTE: You must perform Circuit/System Verification first.

1. Vehicle OFF, disconnect the X1 harness connector at the T18 Battery Charger. Vehicle in Service Mode.
2. Verify the scan tool High Voltage Battery Charger Output Duty Cycle parameter is less than 10%.
 - **If 10% or greater**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module
 2. Test for infinite resistance between the DC voltage sensor circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If less than 10%**
3. Install a 3 A fused jumper wire between the DC voltage sensor circuit terminal 3 and the ground circuit terminal 2.
4. Verify the scan tool Battery Charger DC Output Status Duty Cycle parameter is greater than 90%.
 - **If 90% or less**
 1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module
 2. Vehicle in Service Mode.
 2. Test for less than 1 V between the DC voltage sensor circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Vehicle OFF.
 4. Test for less than 2 Ω in the DC voltage sensor circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 90%**
5. Replace the T18 Battery Charger.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P0D58 OR P0D59: PROXIMITY DETECTION CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D58

Proximity Detection Circuit Low Voltage

DTC P0D59

Proximity Detection Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
AC Voltage Line 1	P1EE6	P1EE6	-	-
AC Voltage Line 2	P1EE6	P1EE6	-	-
AC Voltage Ground	1	P0D59	1	-
Control Pilot Signal	1	1	1	-
Proximity Signal	P0D58	P0D59	P0D59	-
1. Plug In Charging Indicator Malfunction				

Circuit/System Description

The proximity detection circuit prevents movement of the vehicle while the drive motor battery charger cable is connected. This diagnostic runs with the drive motor battery charger cable disconnected to verify the vehicle side circuit integrity.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The vehicle speed is greater than 20 km/h (15 mph) for more than 5 seconds.
- No vehicle speed DTCs are set.

Conditions for Setting the DTC

DTC P0D58

The hybrid/EV powertrain control module 2 measures a voltage less than 4.2 V for 5 seconds.

DTC P0D59

The hybrid/EV powertrain control module 2 measures a voltage greater than 4.8 V for 5 seconds.

Actions Taken When the DTC Sets

- DTC P0D58 and P0D59 are type A DTCs.
- Disable the high voltage battery charging.

Conditions for Clearing the DTC

DTC P0D58 and P0D59 are type A DTCs.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to [High Voltage Disabling](#) .
Reconnect the X2 harness connector at the T18 Battery Charger.

Fig. 5: Hybrid/Ev Battery Charger Receptacle And Terminals
 Courtesy of GENERAL MOTORS COMPANY

NOTE: The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.

2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
 - **If 10 Ω or greater**
 1. Disconnect the X2 harness connector at the T18 Battery Charger.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the T18 Battery Charger.
 - **If less than 10 Ω**
3. Connect the 12 V battery. Vehicle in Service Mode.

Fig. 6: Hybrid/Ev Battery Charger Receptacle And Terminals
 Courtesy of GENERAL MOTORS COMPANY

4. Test for 4.2 - 4.8 V between the signal circuit terminal 5 and ground.

- **If less than 4.2 V**

1. Vehicle OFF, disconnect the harness connector to the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

NOTE: The following tests are performed at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.

2. Test for 4.2 - 4.8 V between the signal circuit terminal 5 and ground.
 - If less than 4.2 V
 3. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 4. Test for infinite resistance between the signal circuit terminal 5 and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
 5. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If greater than 4.8 V**
1. Vehicle OFF, disconnect the X2 harness connector at the T18 Battery Charger. Disconnect the harness connector to the X98 Hybrid/EV Battery Charger Receptacle. Vehicle in Service Mode.

NOTE: The following tests are performed at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.

2. Test for 4.2 - 4.8 V between the signal circuit terminal 5 and ground.
 - If greater than 4.8 V
 3. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 4. Test for less than 1 V between the signal circuit terminal 5 and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V
 5. Test for 2.565 - 2.835K Ω between the signal circuit terminal 5 and the low reference circuit terminal 1.
 - If not within the specified range, replace the X98 Hybrid/EV Battery Charger Receptacle.
 - If within the specified range, replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If within 4.2 - 4.8 V**
5. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Drive Motor Battery Charger Receptacle Replacement
- Control Module References for battery charger or hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0D5A: PROXIMITY DETECTION CIRCUIT ERRATIC

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check -

Vehicle

- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D5A

Proximity Detection Circuit Erratic

Circuit/System Description

This diagnostic runs with the drive motor battery charger cable connected. The hybrid/EV powertrain control module 2 uses a 5 V regulated signal through a 2700 Ω resistor to a low reference circuit in the battery charger to detect if the drive motor battery charger cable is attached.

Conditions for Running the DTC

The drive motor battery charger cable is connected.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 2 determines the proximity signal voltage is erratic for 40 seconds.

Actions Taken When the DTC Sets

DTC P0D5A is a type C DTC.

Conditions for Clearing the DTC

DTC P0D5A is a type C DTC.

Diagnostic Aids

The proximity status circuit is susceptible to moisture intrusion. If signs of moisture intrusion are observed in the hybrid/EV battery charger receptacle harness connector, the hybrid/EV battery charger receptacle should be replaced. If moisture is detected on one connector, always be sure to inspect the mating connector as well.

DTC P0D5C

Battery Charger Hybrid/EV Battery Output Power Performance

[Circuit/System Description](#)

The hybrid/EV powertrain control module 2 monitors the hybrid/EV battery pack voltage and current sensors to determine battery charger output power efficiency.

[Conditions for Running the DTC](#)

- The vehicle 12 V battery system voltage needs to be above 10 V.
- There cannot be any high voltage or current sensor faults present.
- Drive motor battery charger cable must be connected and vehicle receiving power.

[Conditions for Setting the DTC](#)

- Battery charger output power efficiency is less than 67% of nominal value for 10 seconds.
- Hybrid/EV electronics coolant temperature is between -12Â°C (10Â°F) and 65Â°C (149Â°F).

Actions Taken When the DTC Sets

- DTC P0D5C is a type B DTC.
- Disables the high voltage battery charging.

Conditions for Clearing the DTC

DTC P0D5C is a type B DTC.

DTC P0D5E: BATTERY CHARGER SYSTEM HIGH VOLTAGE PRESENT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0D5E

Battery Charger System High Voltage Present

Circuit/System Description

The hybrid/EV battery contains 4 high voltage contactors and 1 transistor. The high voltage contactors allow the high voltage DC batteries to be connected to the vehicle or contain the high voltage DC within the hybrid/EV battery assembly. The 4 high voltage contactors are a main positive high voltage contactor, main negative high voltage contactor, charge positive high voltage contactor, and precharge high voltage contactor. The 1 transistor is the heater transistor. These contactors/transistors close and open in sequence and are controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 supplies voltage to the control circuit for the high voltage contactors/transistors. Ground is provided through the case ground.

Conditions for Running the DTC

- All contactors are commanded open.
- Runs once per charger contacts discharge event.
- None of the following DTCs are set: P0D4D, P0D4E or P0D4F.

Conditions for Setting the DTC

High voltage bus does not discharge to below 60 V within 4 seconds of the charger contactors being commanded open.

Actions Taken When the DTC Sets

- DTC P0D5E is a type A DTC.
- The hybrid/EV powertrain control module 2 opens the high voltage contactors.

Conditions for Clearing the DTC

- DTC P0D5E is a type A DTC.
- The [Clear Secured High Voltage DTCs](#) reset function must be performed with a scan tool before clear codes.

Circuit/System Verification

NOTE: The following setup steps must be performed exactly in order to exercise the contactors.

1. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
2. OPEN the driver door using outside door handle. Leave driver door OPEN.

NOTE: The brake pedal must remain depressed throughout the remainder of the contactor steps.

3. PRESS and HOLD the brake pedal.

NOTE: DO NOT press the power button and enter Vehicle in Service Mode.

4. Command the Hybrid/EV Battery Contactors ALL OPEN with a scan tool.
5. Disconnect the S15 Manual Service Disconnect.

NOTE: DO NOT use the Release Control button to turn OFF any of the contactors. Once the Release Control button is pushed the Circuit/System Verification will need to be restarted from the beginning.

6. Command the Battery Charging System Positive Contactor CLOSED and ALL OPEN with a scan tool while listening for the contactor to close and open. The KR116B Battery Charging System Positive Contactor should be heard closing and opening.

- If the Battery Charging System Positive Contactor does not open and close

Refer to Circuit/System Testing.

- **If the Battery Charging System Positive Contactor does open and close**

7. Replace the T18 Battery Charger.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disconnect the X358 harness connector at the A4 Hybrid/EV Battery Pack.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Verify that a test lamp illuminates between the A4 Hybrid/EV Battery Pack harness B+ circuit terminal 1 X358 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the A28 Hybrid/EV Battery Contactor Assembly and K16 Battery Energy Control Module ensuring you reconnect the connectors in the sequence provided in Repair Instructions. Refer to [Battery Energy Control Module Replacement](#).

- **If the test lamp illuminates**

4. Vehicle OFF, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack. Vehicle in Service Mode.
5. Verify that a test lamp does not illuminate between the A4 Hybrid/EV Battery Pack harness control circuit terminal 7 X357 and ground.

- **If the test lamp illuminates**

1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2. Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid Powertrain Control Module 2.

- **If the test lamp does not illuminate**

6. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid Powertrain Control Module 2.
7. Test for infinite resistance between the A4 Hybrid/EV Battery Pack harness control circuit terminal 7 X357 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

8. Test for less than 2 Ω in the control circuit end to end.

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

9. Replace the K114B Hybrid Powertrain Control Module 2.
10. Verify that DTC P0D5E does not set while operating the vehicle within the Conditions for Running the DTC.

- **If DTC P0D5E is set**

Replace the A28 Hybrid/EV Battery Contactor Assembly.

- **If DTC P0D5E is not set**

11. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Control Module References](#) for battery charger, battery energy control module or hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P0E61 OR P0E65: BATTERY CHARGER ENABLE CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0E61

Battery Charger Enable Circuit

DTC P0E65

Battery Charger Control Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Battery Charger Enable	P0E61	P0E61	P0E61	-
Battery Charger Control	P0E65	P0E65	P0E65	-

Circuit/System Description

The battery charger is controlled with a charger enable signal and a pulse width modulated (PWM) charger control circuit from the hybrid/EV powertrain control module 2. The charger enable signal is set to 12 V when the hybrid/EV powertrain control module 2 is awake. This allows the battery charger to operate while driving to allow DC voltage sensor operation.

Conditions for Running the DTC

DTC P0E61

The 12 V battery voltage is greater than 10.2 V.

DTC P0E65

- The 12 V battery voltage is greater than 10.2 V.
- Vehicle in Service Mode or the drive motor battery charger cable is connected.

Conditions for Setting the DTC

DTC P0E61

The hybrid/EV powertrain control module 2 detects an open, short to ground, or short to voltage on battery charger enable circuit for 1 second.

DTC P0E65

The hybrid/EV powertrain control module 2 detects an open, short to ground, or short to voltage on battery charger control circuit for 1 second.

Actions Taken When the DTC Sets

- DTC P0E61 and P0E65 are type B DTCs.

- Disables high voltage battery charging.

Conditions for Clearing the DTC

DTC P0E61 and P0E65 are type B DTCs.

Circuit/System Testing

1. Vehicle OFF. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. Disconnect the X1 harness connector at the T18 Battery Charger.
2. Test for infinite resistance between the terminals listed below at the T18 Battery Charger X1 harness connector:
 - Battery charger enable terminal 11 and B+ terminal 9
 - Battery charger enable terminal 11 and ground terminal 2
 - Battery charger control terminal 4 and B+ terminal 9
 - Battery charger control terminal 4 and ground terminal 2
 - **If less than infinite resistance**
Repair the short between the circuits.
 - **If infinite resistance**
3. Test for less than 2 Ω between the terminals listed below end to end:
 - T18 Battery Charger terminal 11 X1 and K114B Hybrid/EV Powertrain Control Module 2 terminal 44 X2

- T18 Battery Charger terminal 4 X1 and K114B Hybrid/EV Powertrain Control Module 2 terminal 53 X2
- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

5. Verify P0E61 or P0E65 is not set.

- **If any of the DTCs are set**

Replace the T18 Battery Charger.

- **If none of the DTCs are set**

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for battery charger or hybrid/EV powertrain control module 2 replacement, programming and setup.

DTC P1EE6: BATTERY CHARGER AC VOLTAGE NOT PRESENT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1EE6

Battery Charger AC Voltage Not Present

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
AC Voltage Line 1	P1EE6	P1EE6	-	-
AC Voltage Line 2	P1EE6	P1EE6	-	-
AC Voltage Ground	-	P1EE6	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The hybrid battery charger receptacle is connected to the battery charger through two 110/220 V AC circuits and one ground circuit. When the battery charger has been enabled by the hybrid/EV powertrain control module 2, the battery charger will provide an AC voltage measurement to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 allows charging to occur if proper AC voltage is present.

Conditions for Running the DTC

- The 12 V battery voltage is greater than 10.2 V.
- The drive motor battery charger cable is connected.
- DTCs P0D3E, P0D3F, P0D40, or P0D5C is not set.

Conditions for Setting the DTC

The battery charger AC input voltage is below 5 V.

Actions Taken When the DTC Sets

- DTC P1EE6 is a type C DTC.
- Disables the vehicle high voltage battery charging.

Conditions for Clearing the DTC

DTC P1EE6 is a type C DTC.

Diagnostic Aids

The hybrid/EV battery charger receptacle contains internal fuses on Voltage AC Line 1 and Voltage AC Neutral Line 2 circuits. A battery charger internal failure may cause these fuses to blow. If an open circuit is found in the hybrid/EV battery charger receptacle, the battery charger may also need to be replaced.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Clear DTC, connect a known good drive motor battery charger cable to vehicle and household supply voltage.
2. Verify DTC P1EE6 is set.

- **If DTC P1EE6 is not set**

Replace customer's drive motor battery charger cable.

- **If DTC P1EE6 is set**

3. Vehicle OFF, disable the high voltage at the T18 Battery Charger. Refer to [High Voltage Disabling](#)

4. Disconnect the X2 harness connector at the T18 Battery Charger.

5. Test into the harness for infinite resistance between the 110/220 V AC circuit terminals listed below and ground:

- T18 Battery Charger terminal 1 X2
- T18 Battery Charger terminal 4 X2

- **If less than infinite resistance**

1. Disconnect the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.
2. Test into the harness for infinite resistance between the appropriate 110/220 V AC circuit terminal and ground.

- If less than infinite resistance, repair the short to ground in the circuit.
- If infinite resistance, replace the X98 Hybrid/EV Battery Charger Receptacle.

- **If infinite resistance**

6. Test into the harness for infinite resistance between all the 110/220 V AC circuit terminals listed below:

- T18 Battery Charger terminal 1 X2
- T18 Battery Charger terminal 3 X2
- T18 Battery Charger terminal 4 X2
- **If less than infinite resistance**

1. Disconnect the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.
 2. Test into the harness for infinite resistance between the three 110/220 V AC circuit terminals.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance, replace the X98 Hybrid/EV Battery Charger Receptacle.
- **If infinite resistance**

Fig. 7: Hybrid/Ev Battery Charger Receptacle And Terminals

Courtesy of GENERAL MOTORS COMPANY

7. Test for less than 10 Ω between the 110/220 V AC circuit terminals listed below:

- T18 Battery Charger terminal 1 X2 and X98 Hybrid/EV Battery Charger Receptacle 3
- T18 Battery Charger terminal 3 X2 and X98 Hybrid/EV Battery Charger Receptacle 1
- T18 Battery Charger terminal 4 X2 and X98 Hybrid/EV Battery Charger Receptacle 4
- **If 10 Ω or greater**

1. Disconnect the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.
 2. Test for less than 2 Ω in the 110/220 V AC circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 3. Replace the X98 Hybrid/EV Battery Charger Receptacle.
 4. Verify the DTC does not set.
 - If the DTC sets, replace the T18 Battery Charger and X98 Hybrid/EV Battery Charger Receptacle.
 - If the DTC does not set
 5. All OK.
- **If less than 10 Ω**

8. Replace the T18 Battery Charger.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

110/120 A/C Ground	-	P0D59, 1	1	-
1. Plug In Charging Malfunction				

Circuit/System Description

The drive motor battery charger cable allows the vehicle to be charged using a common household power outlet. The drive motor battery charger cable contains LEDs that indicate the status of the drive motor battery charger cable. The drive motor battery charger cable automatically prohibits voltage transfer to the hybrid/EV battery charger receptacle and the Fault Indicator is illuminated red if it senses internal faults or inadequate household voltage. If the drive motor battery charger cable senses no faults the AC Present Indicator is illuminated solid green.

When the hybrid/EV powertrain control module 2 senses the drive motor battery charger cable is connected to the vehicle charge receptacle, it will communicate with the off-vehicle charge equipment to ensure compatibility and proper function. The hybrid/EV powertrain control module 2 will then indicate the status of charging events (including user-programmable delays) to the user via instrument panel mounted plug-in charging status indicator LEDs and audio tones.

Diagnostic Aids

If the drive motor battery charger cable Fault Indicator is illuminated solid red or flashing red before plugging into the vehicle, the charger cable will need to be diagnosed first.

Circuit/System Verification

1. Vehicle ON, verify no DTCs are set.

- **If DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no DTCs are set**

2. With the charge cord NOT connected to the vehicle battery charger receptacle, verify the vehicle plug-in charging status indicators are OFF.

- **If the vehicle plug-in charging status indicators are not OFF with the charge cord disconnected from the vehicle**

Refer to **Plug-In Charging Indicator Malfunction**.

- **If the vehicle plug-in charging status indicators are OFF**

3. Vehicle OFF and connect the charge cord to the vehicle battery charger receptacle.

4. Verify the vehicle charge status indicators are operating properly.

- **If the vehicle charge status indicator is solid yellow**

Refer to Circuit/System Testing.

- **If the vehicle charge status indicator is not illuminated**

1. Vehicle ON.

NOTE: **Vehicle must be ON and not in Service Mode for message operation.**

2. Verify the Charge Cord Connected message is displayed in the instrument panel/message center.
 - If the Charge Cord Connected message is displayed, refer to **Plug-In Charging Indicator Malfunction**.
 - If the Charge Cord Connected message is NOT displayed, refer to Circuit/System Testing.
- **If the vehicle charge status indicator is operating properly**

5. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Connect the customer's drive motor battery charger cable to household power outlet, but not the vehicle battery charger receptacle.
2. After 25 seconds, verify drive motor battery charger cable AC Present Indicator illuminates solid green.
 - **If drive motor battery charger cable AC Present Indicator does not illuminate solid green**
 1. Connect a known good drive motor battery charger cable to the same household power outlet.
 - If known good drive motor battery charger cable AC Present Indicator illuminates solid green, replace the customer's drive motor battery charger cable.
 - If known good drive motor battery charger cable AC Present Indicator does not illuminate solid green, have the service provider inspect the household power outlet for insufficient voltage, high frequency noise, or open/high resistance.
 - **If drive motor battery charger cable AC Present Indicator does illuminate solid green**

Fig. 8: Drive Motor Battery Charger Cable Terminals
 Courtesy of GENERAL MOTORS COMPANY

3. Test for greater than 1 V between the low voltage circuits listed below on drive motor battery charger cable.

- Proximity status signal circuit terminal 5
- Control pilot signal circuit terminal 2
- **If less than 1 V**

Replace drive motor battery charger cable.

- **If greater than 1 V**

Fig. 9: Hybrid/Ev Battery Charger Receptacle And Terminals
 Courtesy of GENERAL MOTORS COMPANY

NOTE: The following tests are performed at the X98 Hybrid/EV Battery Charger Receptacle and not at the harness connector to the X98 Hybrid/EV Battery Charger Receptacle.

NOTE: When measuring resistance observe proper meter polarity by connecting the common/ground meter probe to ground/vehicle chassis.

NOTE: You must measure with a high-impedance Digital Multimeter (DMM) such as the EL-39200 or equivalent.

4. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Test for 100k Ω - 4M Ω between the control pilot signal terminal 2 at the X98 Hybrid/EV Battery Charger Receptacle and ground.

- **If 4M Ω or greater**

1. Disconnect the X2 harness connector from K114B Hybrid/EV Powertrain Control Module 2
2. Test for 2 Ω in the control pilot signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If less than 100k Ω**

1. Disconnect the X2 harness connector from K114B Hybrid/EV Powertrain Control Module 2
2. Test for infinite resistance between the control pilot signal circuit and ground.
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If within the specified range**

Fig. 10: Hybrid/Ev Battery Charger Receptacle And Terminals

Courtesy of GENERAL MOTORS COMPANY

5. Test for less than 1 V between the control pilot signal terminal 2 at the X98 Hybrid/EV Battery Charger Receptacle and ground.

- **If greater than 1 V**

1. Disconnect the X2 harness connector from K114B Hybrid/EV Powertrain Control Module 2
2. Test for less than 1 V between the control pilot signal circuit and ground.
 - If greater than 1 V, repair the short to voltage in the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If less than 1 V**

6. Vehicle in Service Mode.

Fig. 11: Hybrid/Ev Battery Charger Receptacle And Terminals
Courtesy of GENERAL MOTORS COMPANY

7. Test for 4.2 - 4.8 V between the proximity status signal terminal 5 at the X98 Hybrid/EV Battery Charger Receptacle and ground.
 - **If less than 4.2 V**
 1. Vehicle OFF, test for infinite resistance between the proximity status signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 2. Disconnect the X2 harness connector from K114B Hybrid/EV Powertrain Control Module 2.
 3. Test for less than 2 Ω in the proximity status signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If greater than 4.8 V**
 1. Disconnect the X2 harness connector from K114B Hybrid/EV Powertrain Control Module 2
 2. Test for 0 V between the proximity status signal circuit and ground.
 - If greater than 0 V, repair the short to voltage in the circuit.
 - If 0 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If within the specified range**
8. Vehicle OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down. Disconnect the X2 harness connector from T18 Battery Charger and the X2 harness connector from the K114B Hybrid/EV Powertrain Control Module 2.

Fig. 12: Hybrid/Ev Battery Charger Receptacle And Terminals
Courtesy of GENERAL MOTORS COMPANY

9. Test for infinite resistance between the terminals listed below at the X98 Hybrid/EV Battery Charger Receptacle:

- 110/220 V A/C Line 1 terminal 3 and 110/220 V A/C Neutral Line 2 terminal 4
- 110/220 V A/C Line 1 terminal 3 and 110/220 V A/C Ground terminal 1
- 110/220 V A/C Line 1 terminal 3 and Control pilot signal circuit terminal 2
- 110/220 V A/C Line 1 terminal 3 and Proximity status signal circuit terminal 5
- 110/220 V A/C Neutral Line 2 terminal 4 and 110/220 V A/C Ground terminal 1
- 110/220 V A/C Neutral Line 2 terminal 4 and Control pilot signal circuit terminal 2
- 110/220 V A/C Neutral Line 2 terminal 4 and Proximity status signal circuit terminal 5
- 110/220 V A/C Ground terminal 1 and Control pilot signal circuit terminal 2
- Control pilot signal circuit terminal 2 and Proximity status signal circuit terminal 5

- **If less than infinite resistance**

Repair the short between the circuits.

- **If infinite resistance**

10. Disconnect the harness connector from the X98 Hybrid/EV Battery Charger Receptacle.

Fig. 13: Hybrid/Ev Battery Charger Receptacle And Terminals
Courtesy of GENERAL MOTORS COMPANY

11. Test for 2.56 - 2.84k Ω between the 110/220 V A/C Ground terminal 1 and Proximity status signal circuit terminal 5 at the X98 Hybrid/EV Battery Charger Receptacle.

- **If not within the specified range**

Replace the X98 Hybrid/EV Battery Charger Receptacle.

- **If within the specified range**

NOTE: This test is performed on the vehicle side of the harness connector.

12. Test for infinite resistance between the 110/220 V A/C Ground terminal 1 and Proximity status signal circuit terminal 5 of the harness connector.

- **If less than infinite resistance**

Repair the short between the circuits.

- **If infinite resistance**

13. Replace and program the K114B Hybrid/EV Powertrain Control Module 2.

14. Repeat Circuit/System Verification and confirm vehicle is All OK.

- **If Circuit/System Verification was not All OK**

Replace the T18 Battery Charger.

- **If Circuit/System Verification was All OK**

15. All OK.

Repair Instructions

1. Plug In Charging Indicator Malfunction				

Circuit/System Description

The status of charging events (including delays) is communicated to the user through a vehicle plug-in charge status indicator and audio tones. The vehicle plug-in charge status indicator, located on the top middle of the instrument panel, contains a green LED (charge status indicator) and yellow LED (charge pilot indicator) controlled by the Hybrid Powertrain Control Module 2 and a second green LED (charge complete indicator) controlled by the BCM. The indicator will have a short flash green when the vehicle is charging under automatic control. The flash rate increases from one to four as the battery charges. It will have a long flash green if the charging is delayed and will begin later. It will be illuminated solid green when charging is complete. A solid lit yellow indicator means the vehicle is not able to accept a charge.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U135B is not set.

- **If DTC U135B is set**

Refer to DTC U1340-U135F .

- **If DTC U135B is not set**

3. Verify no other hybrid/EV battery-related DTCs are set.

- **If any hybrid/EV battery-related DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle

- **If no hybrid/EV battery-related DTCs are set**

4. Vehicle OFF. Ensure the charge cord is not connected to the vehicle.

5. Verify the vehicle charge indicator is OFF.

- **If the vehicle charge indicator is not OFF**

Refer to Circuit/System Testing.

- **If the vehicle charge indicator is OFF**

6. Connect the charge cord.

7. Verify the vehicle charge indicator is operating properly.

- **If the vehicle charge indicator is solid yellow**

Refer to Plug-In Charging Malfunction

- **If the vehicle charge indicator is OFF**

1. Vehicle ON.

NOTE: **Vehicle must be ON and not in Service Mode for message operation.**

2. Verify the Charge Cord Connected message is displayed in the instrument panel/message center.

- If the Charge Cord Connected message is displayed, refer to Circuit/System Testing.
- If the Charge Cord Connected message is NOT displayed, refer to Plug-In Charging Malfunction.

- **If the vehicle charge indicator is operating properly**

8. All OK.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disconnect the X1 harness connector at the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.
2. Test for less than 10 Ω between the low reference terminal 1 and ground.

- If 10 Ω or greater

Repair the open/high resistance in the circuit.

- If less than 10 Ω

NOTE: If the drive motor battery charger cable is connected. The drive motor battery charger cable must be disconnected for more than 10 s before performing the next step.

3. Connect a test lamp between the yellow LED control circuit terminal 4 and ground.
4. Verify the test lamp does not illuminate.

- If the test lamp illuminates

1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage in the circuit.
- If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- If the test lamp does not illuminate

5. Connect the drive motor battery charger cable.
6. Verify that the test lamp illuminates or flashes in the first 5 s of connecting the drive motor battery charger

cable.

- **If the test lamp does not illuminate**

1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the control circuit and ground

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp illuminates**

7. Disconnect the drive motor battery charger cable for at least 10 s. Connect a test lamp between the green LED control circuit terminal 3 and ground.

8. Verify test lamp does not illuminate.

- **If the test lamp illuminates**

1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 1 V between the control circuit and ground.

- If 1 V or greater, repair the short to voltage in the circuit.
- If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp does not illuminate**

9. Connect the drive motor battery charger cable.

10. Verify that the test lamp illuminates or flashes within 25 s of connecting the drive motor battery charger cable.

- **If the test lamp does not illuminate**

1. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp illuminates**

11. Replace the B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Sun Load Temperature and Headlamp Automatic Control Ambient Light Sensor Replacement](#) for B305 Ambient Light/Sunload Sensor and Battery State of Charge Indicator replacement.
- [Control Module References](#) for T18 battery charger, or K114B hybrid/EV powertrain control module 2 replacement, programming and setup.

REPAIR INSTRUCTIONS

CHARGE PORT HOUSING BEZEL REPLACEMENT

voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death. Preliminary Procedures 1. Remove the electric vehicle supply equipment (EVSE) charge cord plug handle from the charger receptacle. 2. <u>High Voltage Disabling</u> 3. <u>Charge Port Housing Replacement</u>	
1	Drive Motor Battery Charger Receptacle Fastener (Qty: 4) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 12 N.m (106 lb in)
2	Drive Motor Battery Charger Receptacle Retainer Procedure Using a trim type tool, release the retainer.
3	Drive Motor Battery Charger Receptacle Procedure 1. Open the hood. 2. Disconnect the electrical connector. 3. Unclip the charger receptacle harness retainer. 4. <u>High Voltage Enabling</u>

DESCRIPTION AND OPERATION

PLUG-IN CHARGING SYSTEM DESCRIPTION AND OPERATION

Plug-In Charging System Components

The high voltage battery charging system consists of four main components:

1. The off-vehicle charging equipment:

- Drive motor battery charger cable, often referred to as the travel cord set
- Optional, permanent 230/240 V charge station

2. The hybrid/EV battery charger receptacle, often referred to as the drive motor battery charger receptacle.

3. The battery charger, often referred to as the drive motor battery charger.

4. The hybrid/EV battery pack.

A variety of mechanical, visual, and audio indicators/devices are used to communicate with the user of the charging equipment.

Drive Motor Battery Charger Cable/Charge Station

The drive motor battery charger cable provided with the vehicle features a standard household electrical plug on one end and a plug designed to interface with the vehicles hybrid/EV battery charger receptacle on the other end. The drive motor battery charger cable features a charge current interrupt device with AC power and fault indicators, and it is stored in the vehicle's cargo area. An optional charge station is available for customers who want to reduce the amount of time needed to recharge. The optional charge station, if available, is hard-wired to a 230/240 V power supply and must be permanently mounted at the customer's location. The optional charge station features the same plug on the vehicle end as the drive motor battery charger cable.

The Drive Motor Battery Charger Cable Indicators and the Vehicle Indicators

The drive motor battery charger cable has two indicators, the AC Present Indicator and the Fault Indicator, which display its status.

- Solid green AC Present Indicator means AC voltage is present at the wall plug and there are no faults.
- Flashing green AC Present Indicator and solid red Fault Indicator means the electrical outlet or plug is faulty or overheated.
- Solid red Fault Indicator means the AC outlet does not have a proper ground and charging is not permitted for safety reasons.
- Flashing red Fault Indicator means there is a vehicle fault and the charger cable ground-fault circuit interrupter (GFCI) has tripped.
- Solid green AC Present Indicator and flashing red Fault Indicator means the charger cable has failed self-check.

The off-vehicle battery charging equipment is supervised and controlled by the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 is the primary controller, and all diagnostic trouble codes will set in that module even though some of the diagnostics are actually run within the battery charger. Charging events can be delayed at customer request to take advantage of lower rates during non-peak hours. The status of charging events, including delays, is communicated to the user through visual indications, instrument panel mounted charge status indicator, and audio tones. The vehicle charge status indicator, located on the top middle of the instrument panel, will be short flashing green when the vehicle is charging under automatic control. The flash rate increases from one to four as the battery charges. It will be long flashing green if the charging is delayed and will begin later. It will be solid green when charging is complete. A solid yellow indicator means the vehicle is not able to accept a charge. If there is no indicator, the drive motor battery charger cable is not working properly or not connected.

Vehicle Receptacle

The vehicle receptacle, or hybrid/EV battery charger receptacle, is located behind the charging port door on the driver's side front fender. The receptacle is accessed by depressing and opening the receptacle door. The vehicle may be equipped with a secondary charge status indicator at the receptacle.

Battery Charger

The battery charger is a serviceable assembly containing several micro-processors and two separate high voltage chargers. One of the high voltage chargers is used while charging with a 120 V charge source, and both are used with a 230/240 V charge source. The battery charger is mounted beneath the vehicle cargo load floor. DEX-COOLÂ® coolant is used to ensure that the charger does not exceed its maximum designed operating temperature. The battery charger, along with the 14 V power module and the drive motor generator power inverter module, are cooled by a power electronics cooling loop, which is separate from other cooling systems.

12 V Battery Maintenance Mode

Battery Maintenance Mode is an automatic function that prevents deep discharge of the 12 V battery in specific circumstances. It is enabled when the drive motor battery charger cable is plugged into the hybrid/EV battery charger receptacle and the hybrid/EV battery pack is not being charged. Operation differs depending on whether the power mode is Vehicle Off or Vehicle in Service Mode.

With Vehicle Off, the 12 V battery is monitored at periodic intervals up to a maximum of 30 days. With Vehicle in Service Mode, the 12 V battery is monitored at periodic intervals up to a maximum of 60 hours. If voltage is low, the 12 V battery is charged by the 14 V power module using external power for up to four hours. This function is only intended to prevent a dead 12 V battery and does not provide a full charge. This is more efficient than continuously trickle charging, thus minimizing the usage of external power.

Under normal circumstances, with a 12 V battery that is charged when the vehicle is parked, Battery Maintenance Mode will simply monitor the voltage level, and no charging will be necessary. With Vehicle Off, Battery Maintenance Mode will maintain the 12 V battery for up to 30 days. For longer periods, refer to Owner Manual for instructions.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - MOBILE DEVICE WIRELESS CHARGER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.
- Review the system description and operation in order to familiarize yourself with the system functions. Refer to **Mobile Device Wireless Charger Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories**
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**

Symptom List

Refer to **Mobile Device Wireless Charger Malfunction (with EL-51755)** in order to diagnose the system.

SYMPTOMS - POWER OUTLETS

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the power outlets. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Power Outlet Receptacle Malfunction** in order to diagnose the system.

MOBILE DEVICE WIRELESS CHARGER MALFUNCTION (WITH EL-51755)

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

Ignition	1	1	-	-
Signal	3	2	-	-
Ground	-	1	-	-
1. T22 Mobile Device Wireless Charger Module=Inoperative 2. Wireless Charging Indicator=Off 3. Wireless Charging Indicator=On				

Circuit/System Description

For an overview of the component/system, refer to: [Mobile Device Wireless Charger Description and Operation](#)

Circuit	Description
Ignition	Supplied from a relay.
Signal	The control module input circuit has an internal resistance connected to 12 V. When the switch is closed it will pull the signal voltage low.
Ground	Chassis Ground

Component	Description
T22 Mobile Device Wireless Charger Module	Inductive charging, also known as "wireless charging", uses a magnetic field to transfer energy between two objects. The wireless charger has an induction coil to create an alternating magnetic field. A second induction coil in a portable device takes power from the magnetic field and converts it back into electric current to charge the battery. The two induction coils in proximity work similar as an electrical transformer.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc. The control module also reads various switches and sensors and makes their values available via serial data.

The T22 Mobile Device Wireless Charger Module is controlled by an ignition operated relay and is operational when the ignition is in the Accessory or On position. When a wireless charging device is placed on the charging pad/pocket the charging of the device battery will start. The K9 Body Control Module detects the device battery is charging and sends a serial data message to the P17 Info Display Module which illuminates the charge indicator.

Diagnostic Aids

- Verify the mobile device can be charged with the proper wireless charging adapter. To check for phone or other device compatibility, refer to GM Total Connect website.
- Verify the charging pad/pocket is free from debris or any obstruction that may impede charging.
- The component T22 contains an internal temperature switch that will open if it exceeds 85 °C (185 °F).
- The ambient operating temperature is between -20 and 60 °C (-4 and 140 °F) for the charging system and between 0 and 35 °C (32 and 95 °F) for the mobile device. If the mobile device temperature exceeds 35 °C (95 °F) the mobile device may stop accepting a charge (this may vary with different mobile devices).
- Verify the mobile device is positioned correctly on the charging pad/pocket and there are no foreign objects between the mat and the mobile device. It may be necessary to move the device around slightly or rotate 180 degrees to properly align it on the charging pad/pocket until the device starts to charge. The use of a protective case may require more precise device placement to allow charging or may inhibit charging. Try removing the protective case.
- The mobile device may not charge if the charge mat is NOT completely flat or has an air gap which can be verified by a finger push at the target graphic located at the center of the mat. If the charge mat is NOT flat, replace the charge mat/rubber liner.
- While operating the vehicle in rough conditions, it is possible for the device to move out of position, repositioning of the device may be necessary.
- If the mobile device battery is fully charged, the charge indicator on the P17 Info Display Module may not illuminate.

Special Tools

EL-51755 Inductive Charging Test Tool

Equivalent regional tools: [Special Tools](#)

Circuit/System Verification

WARNING: Remove all objects from the charging pad before charging your mobile device. Objects, such as coins, keys, rings, paper clips, or cards, between the phone and charging pad will become very hot. On the rare occasion that the charging system does not detect an object, and the object gets wedged between the phone and charger, remove the phone and allow the object to cool before removing it from the charging pad, to prevent burns.

1. Ignition - On / Vehicle - In Service Mode
2. Verify the charging pad is clear of any wireless device.

Verify the function: Wireless Charging Indicator=Off

- If the indicator is On

Refer to: Circuit/System Testing

- If the indicator is Off

NOTE: There is a charging coil located in the center of the Charging Pad/Pocket. The EL-51755 Inductive Charging Test Tool has a charging coil in the center of the tool. These coils must be aligned in order for the test tool to illuminate.

To complete successfully, the procedure may need to be repeated 5 times. Between each attempt, remove the tool and wait 3 s.

On a charging pad, align the EL-51755 Inductive Charging Test Tool against the alignment rib. In a pocket, insert the EL-51755 Inductive Charging Test Tool until it stops. For both the pad and pocket, ensure that the flat side (non-LED side) of the EL-51755 Inductive Charging Test Tool aligns against the flat charging surface.

3. Install the special tool: EL-51755 Inductive Charging Test Tool @ Charging Pad/Pocket

Verify the function: Special Tools LED (Light Emitting Diode) = On

- If the special tool is Off

Refer to: Circuit/System Testing

- If the special tool is On

4. Verify the function: Wireless Charging Indicator = On

- If the indicator is Off

Refer to: Circuit/System Testing

- If the indicator is On

NOTE: The customer's device may not be compatible or is defective.

5. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: T22 Mobile Device Wireless Charger Module
3. Test for less than 10 ohms between the test points: Ground circuit terminal 2 & Ground
 - **If 10 ohms or greater**
 1. Disconnect ground terminal.
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 1 @ Component harness & The other end of the circuit @ Ground terminal
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: Ignition circuit terminal 1 & Ground
 - **If the test lamp does not turn On and the circuit fuse is OK**
 1. Remove - Test Lamp
 2. Test for less than 2 ohms between the test points: Ignition circuit terminal 1 & Output terminal @ Fuse
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms Refer to: **Retained Accessory Power Malfunction**
 - **If the test lamp does not turn On and the circuit fuse is open**
 1. Remove - Test Lamp
 2. Test for infinite resistance between the test points: Ignition circuit terminal 1 & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: T22 Mobile Device Wireless Charger Module.
 - **If the test lamp turns On**
6. Verify the function: Wireless Charging Indicator = Off
 - **If the indicator is On**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector: K9 Body Control Module
 3. Test for infinite resistance between the test points: Signal circuit terminal 3 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K9 Body Control Module
 - **If the indicator is Off**
7. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 3 & Ground circuit terminal 2
8. Verify the function: Wireless Charging Indicator = On

- **If the indicator is Off**

1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
2. Disconnect the electrical connector: K9 Body Control Module
3. Ignition - On / Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Signal circuit terminal 3 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
5. Ignition/Vehicle - Off
6. Test for less than 2 ohms between the test points: Signal circuit terminal 3 @ Component harness & The other end of the circuit @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K9 Body Control Module

- **If the indicator is On**

9. Test or replace the component: T22 Mobile Device Wireless Charger Module

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

[Wireless Charging System Module Replacement](#) - T22 Mobile Device Wireless Charger Module

POWER OUTLET RECEPTACLE MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Ground	-	1	-	-
1. Accessory Power Receptacle Malfunction				

Circuit/System Description

The vehicle is fitted with a 12 V accessory power receptacle. The accessory power outlets are controlled by an ignition operated relay. The accessory power receptacle is operational when Vehicle in Service Mode or Vehicle ON.

Diagnostic Aids

It may be helpful to discuss with the customer the usage of any device that may have drawn too much current and caused an open fuse.

Connector End View Reference

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Power Outlets Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Circuit/System Verification

1. Vehicle in Service Mode, connect an appropriate device to the X80 Accessory Power Receptacle.
2. Verify the device is powered by the X80 Accessory Power Receptacle.

- **If the device is not powered**

Refer to Circuit/System Testing

- **If the device is powered**

3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.

- **If greater than 10 Ω**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the control circuit terminal A and ground.
 - **If the test lamp does not illuminate and the circuit fuse/circuit breaker is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the control circuit end to end.

- If greater than 2 Ω , repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse/circuit breaker is not open and there is voltage at the fuse/circuit breaker. Refer to [Retained Accessory Power Malfunction](#).
- **If the test lamp does not illuminate and the circuit fuse/circuit breaker is open**
 1. Vehicle OFF.
 2. Test for infinite resistance between the control circuit terminal A and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate X80 Accessory Power Receptacle.
 - **If the test lamp illuminates**
- 5. Replace the appropriate X80 Accessory Power Receptacle or E32 Cigarette Lighter Receptacle.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Accessory Power Receptacle Replacement](#)

5. Install Front Floor Console Bracket Bolt (1) and tighten 2.5 N.m (22 lb in)
6. Install **Front Floor Rear Console Side Trim Panel Replacement - Right Side**
7. Install **Front Floor Rear Console Side Trim Panel Replacement - Left Side**

ACCESSORY POWER RECEPTACLE REPLACEMENT

Special Tools

EL-42059 Cigar Lighter Socket Remover

For equivalent regional tools, refer to **Special Tools**.

Removal Procedure

Fig. 8: View Of Cigar Lighter Socket/Accessory Power Outlet
Courtesy of GENERAL MOTORS COMPANY

1. Remove the auxiliary power outlet fuse from the fuse block.
2. Remove the receptacle:
 1. Look into the receptacle. There are two 3 mm (0.11 in) tab windows 12 mm (0.47 in) from the front of the receptacle. The **EL-42059** remover pushes the plastic latches from these tab windows and the receptacle can be pulled straight out.
 2. Place one side of the "T" portion of the **EL-42059** remover into the tab window. The **EL-42059** remover will not fit straight into the receptacle. Angle the slightly for insertion into the receptacle.
 3. Insert the other side of the "T" into the opposite tab window.

You must move the **EL-42059** remover handle toward horizontal to engage the other tab window.

4. Use the **EL-42059** remover to pull the receptacle straight out.

Fig. 9: Removing Cigar Housing Using Grinding Tool

Courtesy of GENERAL MOTORS COMPANY

3. If **EL-42059** remover tool fails to release the lighter socket from the retainer, perform the following alternate method:
 1. Insert a small grinding tool with a cutoff wheel into the socket.
 2. Remove the plastic latches in the 3 mm (0.11 in) square windows.
 3. Use the **EL-42059** remover as directed above to remove the socket.

Installation Procedure

Fig. 10: View Of Receptacle Tabs & Retainer Slots

Courtesy of GENERAL MOTORS COMPANY

1. Route the connector through the retainer. Align the accessory power receptacle retainer to the slot in the opening.
2. Install the retainer by pressing into place fully seated.
3. Connect the electrical connector to the receptacle.
4. Align the tabs on the receptacle to the slots in the retainer. Install the accessory power receptacle by pressing into place until fully seated.
5. Install the accessory power receptacle fuse.

DESCRIPTION AND OPERATION

MOBILE DEVICE WIRELESS CHARGER DESCRIPTION AND OPERATION

Mobile Device Wireless Charging System

Fig. 11: Mobile Device Wireless Charging System Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K9	K9 Body Control Module
T22	Mobile Device Wireless Charger Module
K74	Human Machine Interface Control Module
P17	P17 Info Display Module

The Mobile Device Wireless Charging System (WCS) is an system for wirelessly charging mobile devices. It is capable of charging the batteries of compatible mobile devices. A compatible device is one that is compliant with Power Matters Alliance (PMA) or Wireless Power Consortium (WPC) Standard, meaning that it is equipped with a PMA or WPC wireless charge "receiver" that will work with the charge "transmitter" installed in the vehicle. The devices may utilize built-in charging circuitry or an adapter (external plug-in device which contains the charging circuitry). To check for phone or other device compatibility, refer to GM Total Connect.

WARNING: Remove all objects from the charging pad before charging your mobile device. Objects, such as coins, keys, rings, paper clips, or cards, between the phone and charging pad will become very hot. On the rare occasion that the charging system does not detect an object, and the object gets wedged between the phone and charger, remove the phone and allow the object to cool before removing it from the charging pad, to prevent burns.

Charging

To charge a device, place it on the charging surface in the vehicle. There is a charging coil located in the center of the charging surface. The device has a charging coil typically near the center of the device. These coils must

be lined up in order for charging to proceed. When the interruptible retained accessory power (IRAP) relay is closed (this is true typically when vehicle ignition is in Run or Accessory position), the WCS will detect the device, establish communications with the device to confirm it is a compatible device, and then deliver charging power to the device via wireless interface. The WCS will be able to deliver up to 5W of power to compatible devices. It shall only enter a charging state if communication is established and a compatible device is identified.

The WCS shall not enter a charging state if there is no communication established with a compatible device. If a non-compatible device or metallic foreign object is detected, the WCS will not transfer power. The charger monitors its internal temperature and will shut down if the charger temperature exceeds 185F (85C).

Indicator

The body control module will detect the device battery is charging and send a serial data message on the GMLAN bus to the radio display. The radio display will indicate a device is currently charging. When the indicator is toggling on and off this indicates a thermal limit has been reached and the device will not charge. For more information refer to the infotainment owners manual.

POWER OUTLETS DESCRIPTION AND OPERATION

12 Volt Power Outlet Receptacle Description and Operation

The accessory power receptacles and cigarette lighter receptacle are supplied with 12 V when the vehicle is in Service Mode or in Vehicle ON Mode.

A28 HYBRID/EV BATTERY CONTACTOR ASSEMBLY X3

Connector Part Information

- Harness Type: Battery Cable
- OEM Connector: 33201523
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F Power Pack 2000 Series, Sealed (OG)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	No Tool Required	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
A	35	OG	7639	High Voltage Battery Pack Traction Power Inverter Module Positive Control	I	-

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
B	35	OG/BK	7644	High Voltage Battery Pack Traction Power Inverter Module Negative Control	I	-

A28 HYBRID/EV BATTERY CONTACTOR ASSEMBLY X4

Connector Part Information

- Harness Type: Battery Cable
- OEM Connector: 33184733
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F HVA280-2PHI Series, Sealed (OG)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35 (VT)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	5	OG	3970	High Voltage Battery 4 (+)	I	-
2	5	OG/BK	3969	High Voltage Battery 4 (-)	I	-

A28 HYBRID/EV BATTERY CONTACTOR ASSEMBLY X5

Connector Part Information

- Harness Type: Battery Cable
- OEM Connector: 33156861
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F HVA280-2PHI Series, Sealed (OG)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35 (VT)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	5	OG	3974	High Voltage Battery 5 (+)	I	-
2	5	OG/BK	3973	High Voltage Battery 5 (-)	I	-

A28 HYBRID/EV BATTERY CONTACTOR ASSEMBLY X6

Connector Part Information

- Harness Type: Battery Cable
- OEM Connector: 33184905
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F HVA280-2PHI Series, Sealed (OG)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35 (VT)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	3	OG	3834	High Voltage Battery 2 (+)	I	-
2	3	OG/BK	3833	High Voltage Battery 2 (-)	I	-

A28 HYBRID/EV BATTERY CONTACTOR ASSEMBLY X7

Connector Part Information

- Harness Type: HV Energy Storage
- OEM Connector: Not Available
- Service Connector: Service by Cable Assembly - See Part Catalog
- Description: 1-Way Ring Terminal

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	No Tool Required	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	20	OG	5084	High Voltage Battery (+)	I	-

A28 HYBRID/EV BATTERY CONTACTOR ASSEMBLY X8

Connector Part Information

- Harness Type: HV Energy Storage
- OEM Connector: Not Available
- Service Connector: Service by Cable Assembly - See Part Catalog
- Description: 1-Way Ring Terminal

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	No Tool Required	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	20	OG/BK	5083	High Voltage Battery (-)	I	-

B1 A/C REFRIGERANT PRESSURE SENSOR

Connector Part Information

- Harness Type: Engine
- OEM Connector: 13602480
- Service Connector: 88988301
- Description: 3-Way F 150 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BK/WH	2151	Signal Ground	I	E80
2	0.5	BN/RD	2700	A/C Pressure Sensor 5V Reference	I	E80
3	0.5	GN	380	A/C Refrigerant Pressure Sensor Signal	I	E80

B1C A/C LOW SIDE PRESSURE SENSOR

Connector Part Information

- Harness Type: Engine
- OEM Connector: 13602480
- Service Connector: 88988301
- Description: 3-Way F 150 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BK/GN	476	Sensor Low Reference	I	-
2	0.5	BU/RD	474	5V Reference	I	-
3	0.5	BU	204	A/C Low Pressure Sensor Signal	I	-

B5LF WHEEL SPEED SENSOR - LEFT FRONT

Connector Part Information

- Harness Type: Body
- OEM Connector: 7287-0973-30
- Service Connector: 13586115
- Description: 2-Way F 1.5 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/WH	7064	Wheel Speed Sensor Control Left Front	I	-
2	0.5	GY	830	Wheel Speed Sensor Signal Left Front	I	-

B5LR WHEEL SPEED SENSOR - LEFT REAR

Connector Part Information

- Harness Type: Body
- OEM Connector: 7287-0973-30
- Service Connector: 13586115
- Description: 2-Way F 1.5 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/BK	7127	Wheel Speed Sensor Control Left Rear	I	-
2	0.5	BU	884	Wheel Speed Sensor Signal Left Rear	I	-

B5RF WHEEL SPEED SENSOR - RIGHT FRONT

Connector Part Information

- Harness Type: Body
- OEM Connector: 7287-0973-30
- Service Connector: 13586115
- Description: 2-Way F 1.5 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/BN	7065	Wheel Speed Sensor Control Right Front	I	-
2	0.5	YE	872	Wheel Speed Sensor Signal Right Front	I	-

B5RR WHEEL SPEED SENSOR - RIGHT REAR

Connector Part Information

- Harness Type: Body
- OEM Connector: 7287-0973-30
- Service Connector: 13586115
- Description: 2-Way F 1.5 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/YE	7128	Wheel Speed Sensor Control Right Rear	I	-
2	0.5	VT	882	Wheel Speed Sensor Signal Right Rear	I	-

B7D AIR TEMPERATURE SENSOR - DUCT LEFT LOWER

Connector Part Information

- Harness Type: HVAC
- OEM Connector: Not Available
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.75	BN	518	Lower Left Air Temperature Sensor Signal	I	-
2	0.35	BK	407	Sensor Low Reference	I	-

B7H AIR TEMPERATURE SENSOR - DUCT LEFT UPPER

Connector Part Information

- Harness Type: HVAC
- OEM Connector: Not Available
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	VT	516	Upper Left Air Temperature Sensor Signal	I	-
2	0.35	BK	407	Sensor Low Reference	I	-

B9 AMBIENT AIR TEMPERATURE SENSOR

Connector Part Information

- Harness Type: Front Fascia
- OEM Connector: 1-1718643-1
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BU/GY	636	Outside Ambient Air Temperature Sensor Signal	I	-
2	0.5	BK/BU	61	Outside Ambient Temperature Sensor Low Reference	I	-

B14A TRANSMISSION OUTPUT SHAFT SPEED SENSOR

Connector Part Information

- Harness Type: Transmission
- OEM Connector: 33145080
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 OCS Series (NA)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	VT	3604	Transmission Output Speed Sensor Supply	I	-
2	0.5	RD	3098	Output Speed (Digital) Signal	I	-

B15 TRANSMISSION INTERNAL MODE SWITCH

Connector Part Information

- Harness Type: Transmission
- OEM Connector: 13960977
- Service Connector: Service by Harness - See Part Catalog
- Description: 8-Way F 0.64 II Series (GY)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	PK	3992	Internal Mode Switch Voltage Supply A	I	-
2	0.5	BK	3494	Transmission IMS Mode Switch R1 bit Signal	I	-
3	0.5	BN	3496	Transmission IMS Mode Switch D1 bit Signal	I	-
4	-	-	-	Not Occupied	-	-
5	0.5	GN	3493	Transmission IMS Mode Switch S bit Signal	I	-
6	0.5	BU	3495	Transmission IMS Mode Switch R2 bit Signal	I	-

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
7	0.5	GY	3497	Transmission IMS Mode Switch D2 bit Signal	I	-
8	0.5	OG	3991	Internal Mode Switch Voltage Supply B	I	-

B18 BATTERY CURRENT SENSOR

Connector Part Information

- Harness Type: Body
- OEM Connector: 34250-3001
- Service Connector: 19179750
- Description: 3-Way F 1.5 Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-2A (GY)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	BU/VT	5076	Current Sensor Control	I	-
2	0.35	BK/VT	5077	Current Sensor Low Reference	I	-

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
3	0.35	WH/YE	5075	Current Sensor Signal	I	-

B20 BRAKE FLUID LEVEL SWITCH

Connector Part Information

- Harness Type: Body
- OEM Connector: 10010337
- Service Connector: 13587326
- Description: 2-Way F 1.2 Multilock Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BK	1550	Ground	I	-
2	0.5	GN/GY	333	Brake Fluid Level Sensor Signal	I	-

B22 BRAKE PEDAL POSITION SENSOR

Connector Part Information

- Harness Type: Instrument Panel
- OEM Connector: 31404-6810
- Service Connector: 19304011
- Description: 6-Way F 64 Series, Sealed (NA)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	WH	5359	Brake Apply Sensor Control	I	-
2	0.35	BK/BN	5360	Brake Apply Sensor Low Reference	I	-
3	0.35	BU/YE	5361	Brake Apply Sensor Signal	I	-
4	0.35	WH/GN	5380	Brake Position Sensor Signal	I	-
5	0.35	WH/RD	5381	Brake Position Sensor 5V Reference	I	-
6	0.35	BK/YE	5382	Brake Position Sensor Low Reference	I	-

B23E CAMSHAFT POSITION SENSOR - EXHAUST

Connector Part Information

- Harness Type: Engine
- OEM Connector: 2098541-5
- Service Connector: 19329387
- Description: 3-Way F 1.2 MCP Series, Sealed (BN)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/YE	5297	Camshaft Position Exhaust Sensor Control 1	I	-
2	0.5	BK/GY	5296	Camshaft Position Exhaust Sensor Low Reference 1	I	-
3	0.5	VT/BK	5273	Camshaft Position Exhaust Sensor 1	I	-

B23F CAMSHAFT POSITION SENSOR - INTAKE

Connector Part Information

- Harness Type: Engine
- OEM Connector: 2098541-5
- Service Connector: 19329387
- Description: 3-Way F 1.2 MCP Series, Sealed (BN)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/BU	5300	Camshaft Position Intake Sensor Control 1	I	-
2	0.5	BK/GN	5301	Camshaft Position Intake Sensor Low Reference 1	I	-
3	0.5	YE/VT	5275	Camshaft Position Intake Sensor 1	I	-

B24 MOBILE TELEPHONE MICROPHONE

Connector Part Information

- Harness Type: Headliner
- OEM Connector: 12047663
- Service Connector: 13584278
- Description: 2-Way M 150 Metri-Pack Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-3 (GY)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
A	0.5	BK/BN	654	Cellular Telephone Microphone Low Reference	I	-
B	0.5	BU	655	Cellular Telephone Microphone Signal	I	-

B26 CRANKSHAFT POSITION SENSOR

Connector Part Information

- Harness Type: Engine
- OEM Connector: 2098541-5
- Service Connector: 19329387
- Description: 3-Way F 1.2 MCP Series, Sealed (BN)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	VT/BU	6270	Crankshaft 60X Sensor 5V Reference	I	-
2	0.5	BK/VT	6272	Crankshaft 60X Sensor Low Reference	I	-
3	0.5	GN	6271	Crankshaft 60X Sensor Signal	I	-

B30 HYBRID/EV BATTERY PACK CURRENT SENSOR

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33124854
- Service Connector: Service by Harness - See Part Catalog
- Description: 4-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
A	0.5	BU/YE	2962	High Voltage Battery Current Sensor Course Signal	I	-
B	0.5	VT/RD	2965	High Voltage Battery Current Sensor Voltage Reference	I	-
C	0.5	BK/GY	2963	High Voltage Battery Current Sensor Low Reference	I	-
D	0.5	GN/BN	2961	High Voltage Battery Current Sensor Fine Signal	I	-

B32A HYBRID/EV BATTERY TEMPERATURE SENSOR 1

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33148040
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	BN	5405	Battery Module Temperature Signal 1	I	-
2	0.35	BK/BN	3773	Battery Module Temperature Sensor Low Reference 1	I	-

B32B HYBRID/EV BATTERY TEMPERATURE SENSOR 2

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33148040
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	BN/WH	5406	Battery Module Temperature Signal 2	I	-
2	0.35	BK/BU	3774	Battery Module Temperature Sensor Low Reference 2	I	-

B32C HYBRID/EV BATTERY TEMPERATURE SENSOR 3

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33148040
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	GN/GY	5407	Battery Module Temperature Signal 3	I	-
2	0.35	BK/GN	3775	Battery Module Temperature Sensor Low Reference 3	I	-

B32D HYBRID/EV BATTERY TEMPERATURE SENSOR 4

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33148040
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	WH/BK	5408	Battery Module Temperature Signal 4	I	-
2	0.35	BK/GY	3776	Battery Module Temperature Sensor Low Reference 4	I	-

B32E HYBRID/EV BATTERY TEMPERATURE SENSOR 5

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33148040
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	GN/BK	5409	Battery Module Temperature Signal 5	I	-
2	0.35	BK/VT	3777	Battery Module Temperature Sensor Low Reference 5	I	-

B32F HYBRID/EV BATTERY TEMPERATURE SENSOR 6

Connector Part Information

- Harness Type: Auxiliary Battery Cable
- OEM Connector: 33148040
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	GY/BN	5410	Battery Module Temperature Signal 6	I	-
2	0.35	BK/YE	3778	Battery Module Temperature Sensor Low Reference 6	I	-

B34 ENGINE COOLANT TEMPERATURE SENSOR

Connector Part Information

- Harness Type: Engine
- OEM Connector: 13503566
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.2 Multilock Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BU	410	Engine Coolant Temperature Sensor Signal	I	-
2	0.5	BK/WH	2051	Signal Ground	I	-

B37B ENGINE OIL PRESSURE SENSOR

Connector Part Information

- Harness Type: Engine
- OEM Connector: 13503573
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F 1.2 Multilock Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	Not Available	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	YE/BN	331	Oil Pressure Sensor Signal	I	-
2	0.5	BK/VT	2755	Oil Pressure Sensor Low Reference	I	-
3	0.5	WH/RD	2705	Oil Pressure Sensor 5V Reference	I	-

B47 FUEL PRESSURE SENSOR

Connector Part Information

- Harness Type: Body
- OEM Connector: 13511131
- Service Connector: 19168035
- Description: 3-Way F 150 GT Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	BU/WH	7446	Fuel Line Pressure Sensor Signal	I	-
2	0.35	BK/YE	7447	Fuel Line Pressure Sensor Low Reference	I	-
3	0.35	BN/RD	7445	Fuel Line Pressure Sensor 5V Reference	I	-

B52A HEATED OXYGEN SENSOR 1

Connector Part Information

- Harness Type: Engine
- OEM Connector: 10010348
- Service Connector: 19301716
- Description: 4-Way F 1.2 Multilock Series, Sealed (D-GY)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/WH	3113	Heated Oxygen Sensor Heater Low Control Bank 1 Sensor 1	I	-
2	0.5	VT/BU	5293	Powertrain Main Relay Fused Supply 4	I	-
3	0.5	WH/BK	3111	Heated Oxygen Sensor Low Signal Bank 1 Sensor 1	I	-
4	0.5	VT/GY	3110	Heated Oxygen Sensor High Signal Bank 1 Sensor 1	I	-

B52B HEATED OXYGEN SENSOR 2

Connector Part Information

- Harness Type: Engine
- OEM Connector: 10010348
- Service Connector: 19301716
- Description: 4-Way F 1.2 Multilock Series, Sealed (D-GY)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	GY/WH	3122	Heated Oxygen Sensor Heater Low Control Bank 1 Sensor 2	I	-
2	0.5	VT/BU	5294	Powertrain Main Relay Fused Supply 5	I	-

B258 HYBRID/EV BATTERY COOLANT LEVEL SWITCH

Connector Part Information

- Harness Type: Cooling Fan
- OEM Connector: 12186685
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 150 Metri-Pack Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
A	0.5	BU/YE	68	Low Coolant Level Indicator Control	I	-
B	0.5	BK/GN	476	Sensor Low Reference	I	-

B284 VEHICLE DYNAMIC SENSOR

Connector Part Information

- Harness Type: Body
- OEM Connector: 47715-6100
- Service Connector: 19299684

- Description: 6-Way F 0.64 Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	Not Required	Not Required	Not Required	Not Required	Not Required

6	0.5	BK	850	Ground	I	-

B305 AMBIENT LIGHT/SUNLOAD SENSOR AND BATTERY STATE OF CHARGE INDICATOR

Connector Part Information

- Harness Type: Instrument Panel

- OEM Connector: 965413-1
- Service Connector: 19333315
- Description: 6-Way F 0.64 Micro-Quadlock Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	BK	2150	Ground	I	-
2	0.35	GN/WH	4115	Local Interconnect Network Serial Data Bus 15	I	-
3	0.35	YE/VT	3956	Charging Status Indicator Control	I	-
4	0.35	GY/GN	3957	Charging Pilot Signal Indicator Control	I	-
5	0.35	RD/WH	3440	Battery Positive Voltage	I	-
6	0.5	BK	2150	Ground	I	-

B306A PARKING ASSIST SENSOR - FRONT LEFT OUTER

Connector Part Information

- Harness Type: Front Fascia

- OEM Connector: 1488991-5
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	RD/BU	5974	Park Assist Sensor Control Park	I	-
2	0.5	VT/WH	5215	Front Parking Left Corner Sensor	I	-
3	0.5	BK/BU	5214	Front Parking Sensor Low Reference	I	-

B306B PARKING ASSIST SENSOR - FRONT LEFT MIDDLE

Connector Part Information

- Harness Type: Front Fascia
- OEM Connector: 1488991-5
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	RD/BU	5974	Park Assist Sensor Control Park	I	-
2	0.5	YE/GY	5216	Front Parking Left Mid Sensor	I	-
3	0.5	BK/BU	5214	Front Parking Sensor Low Reference	I	-

B306C PARKING ASSIST SENSOR - FRONT RIGHT MIDDLE

Connector Part Information

- Harness Type: Front Fascia
- OEM Connector: 1488991-5
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
------------------	-----------------	-----------------------	-----------------------	------------------	-----------	------------	------------------

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-16 (LT GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	RD/BU	5974	Park Assist Sensor Control Park	I	-
2	0.5	VT/GY	5218	Front Parking Right Mid Sensor	I	-
3	0.5	BK/BU	5214	Front Parking Sensor Low Reference	I	-

B306D PARKING ASSIST SENSOR - FRONT RIGHT OUTER

Connector Part Information

- Harness Type: Front Fascia
- OEM Connector: 1488991-5
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F 1.2 MCP Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp

E63D FLOOD LAMP - DRIVER DOOR HANDLE

Connector Part Information

- Harness Type: Driver Door Trim
- OEM Connector: 1563189-1
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.6 Timer Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.5	WH/YE	7557	LED Ambient Lighting Control 1	I	-
2	0.5	BK	1550	Ground	I	-

E63LR FLOOD LAMP - LEFT REAR DOOR HANDLE

Connector Part Information

- Harness Type: Left Rear Door
- OEM Connector: 1563189-1
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 1.6 Timer Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-14 (GN)	No Tool Required	Not Required	Not Required	Not Required	Not Required

K89 IMMOBILIZER CONTROL MODULE

Connector Part Information

- Harness Type: Floor Console
- OEM Connector: 4-1718346-1
- Service Connector: Service by Harness - See Part Catalog
- Description: 3-Way F 0.64 Micro-Quadlock Series (PU)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	0.35	GN/GY	3277	Vehicle Anti-Theft System Immobilizer Low Reference	I	-
2	0.35	GN/VT	7533	Local Interconnect Network Serial Data Bus 11	I	-
3	0.35	GY/BK	3276	Vehicle Anti-Theft System Immobilizer Control	I	-

K109 FRONTVIEW CAMERA MODULE

Connector Part Information

- Harness Type: Body
- OEM Connector: 34824-1124
- Service Connector: 13588265
- Description: 12-Way F Mini 50 Series (BK)

M74D WINDOW MOTOR - DRIVER

Connector Part Information

- Harness Type: Driver Door
- OEM Connector: 1-1732115-1
- Service Connector: Service by Harness - See Part Catalog
- Description: 7-Way F 0.64, 2.8 Kaizen Timer Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-4A (PU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

7	0.35	GY	3380	Power Window Switch Driver Down Signal	II	-

M74LR WINDOW MOTOR - LEFT REAR

Connector Part Information

- Harness Type: Left Rear Door
- OEM Connector: 54200220N
- Service Connector: Service by Harness - See Part Catalog
- Description: 2-Way F 2.8 Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35	No Tool	Not Required	Not	Not	Not

1	2.5	WH	2001	Park Brake Motor Apply Left Rear Control	I	-
2	2.5	GY/BK	4369	Park Brake Motor Low Reference Left Rear	I	-

M104R PARK BRAKE ACTUATOR - RIGHT

Connector Part Information

- Harness Type: Body
- OEM Connector: 1928405715
- Service Connector: 19299882
- Description: 2-Way F 2.8 Series, Sealed (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-35 (VT)	Not Required	Not Required	Not Required	Not Required	Not Required

Pin	Size	Color	Circuit	Function	Terminal Type ID	Option
1	2.5	GN/VT	1988	Park Brake Motor Apply Right Rear Control	I	-
2	2.5	GY	4368	Park Brake Motor Low Reference Right Rear	I	-

P2 TRANSMISSION SHIFT LEVER POSITION INDICATOR

Connector Part Information

- Harness Type: Floor Console
- OEM Connector: 24414934
- Service Connector: Service by Harness - See Part Catalog
- Description: 6-Way F 0.64 Micro-Quadlock Series (BK)

Terminal Part Information

Terminal Type ID	Terminated Lead	Diagnostic Test Probe	Terminal Removal Tool	Service Terminal	Tray Name	Core Crimp	Insulation Crimp
I	Not Required	J-35616-64B (LT BU)	No Tool Required	Not Required	Not Required	Not Required	Not Required

ELECTRICAL

Wiring Systems and Power Management - Description and Operation - Volt

DESCRIPTION AND OPERATION

ELECTRONIC PARK LOCK DESCRIPTION AND OPERATION

If the vehicle is equipped with automatic transmission and a floor mounted console gear shift, it has an electronic park lock system. The electronic park lock system purpose is to prevent the ignition from being switched to the Vehicle OFF position when the transmission is in any position other than PARK and the vehicle may still be moving. The electronic park lock system incorporates the park position switch that located in the A/T shift lock control switch. When the transmission shift selector is in PARK, the park position switch closes and the BCM allows the ignition to be turned Vehicle OFF.

If the vehicle is not in PARK, the ignition will return to ACC/ACCESSORY and display the message SHIFT TO PARK in the Driver Information Center. When the vehicle is shifted into PARK, the ignition system will switch to Vehicle OFF.

POWER MODE DESCRIPTION AND OPERATION

Serial Data Power Mode Master

Power to many of this vehicles circuits is controlled by the module that is designated the power mode master. This vehicles power mode master is the body control module (BCM). The BCM has multiple B+ circuits that feed into it. Each of those circuits are partitioned within the controller to drive certain outputs of the vehicle's body functions. An open or short in any one of the B+ circuits may induce multiple codes/or a section of non-functionality within the BCM with the rest of the BCM functioning normally. In this case it is useful to refer to the power distribution schematics to determine if the non-functional partition of the controller shares a common B+ circuit. The power button switch is a low current push button switch with discrete power button switch signals to the power mode master for determination of the power mode that will be sent over the serial data circuits to the other modules that need this information. The power mode master will also activate relays and other direct outputs of the power mode master as needed. The power mode master determines which power mode (Vehicle Off, Vehicle On, Vehicle in Service Mode) is required, and reports this information to other modules via serial data. Modules which have switched voltage inputs may operate in a default mode if the power mode serial data message does not match what the individual module can see from its own connections.

The power mode master receives power button switch signals and transmitter in range signals to identify the operators desired power mode. The Power Mode Parameters table below illustrates the correct state of these input parameters (circuits) in correspondence to the power button switch position and the transmitter to vehicle range:

Power Mode Parameters

Power Mode	Power Mode Transmitted	Push Button Ignition Switch (Power Button Switch Circuit Input to the BCM)	Push Button Ignition Switch Voltage Push Button Ignition Switch Voltage Input to the BCM	Key in Cylinder Switch/Key Fob in Vehicle (Transmitter in Range to the BCM Signal)
Transmitter in Range	Vehicle Off	Inactive	9 V	Yes
Transmitter out of Range	Vehicle Off	Inactive	9 V	No
Vehicle On Power Mode, then Press the Power Button Switch (Foot on or off the Brake Pedal); Transmitter in Vehicle	Vehicle Off	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes
Vehicle Off Power Mode, then Press the Power Button	Vehicle On	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes

Power Mode	Power Mode Transmitted	Push Button Ignition Switch (Power Button Switch Circuit Input to the BCM)	Push Button Ignition Switch Voltage Push Button Ignition Switch Voltage Input to the BCM	Key in Cylinder Switch/Key Fob in Vehicle (Transmitter in Range to the BCM Signal)
Switch with foot on the Brake Pedal; Transmitter in Vehicle				
Vehicle Off Power Mode, then Press and Hold the Power Button Switch for 5 s with foot off the Brake Pedal; Transmitter in Vehicle	Vehicle in Service Mode	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes
Vehicle Off Power Mode, then Press and Hold the Power Button Switch for over 10 s with foot off the Brake Pedal; Transmitter in Vehicle	Vehicle in Service Mode	Active (pushed)/Inactive (not pushed)	6 V (pressed)	Yes

Relay Controlled Power Mode

The BCM uses the discrete power button switch inputs, transmitter in range status, current power mode state, and the brake pedal position state to distinguish the correct power mode (Vehicle Off, Vehicle On, and Vehicle in Service Mode). The BCM, after determining the desired power mode, will activate the appropriate relays for that power mode and send the power mode message out to other modules in a serial data message.

The retained accessory power relay remains on for a timed period after the power mode transitions to Vehicle Off. Refer to [Retained Accessory Power Description and Operation](#) for more information on the retained accessory power function.

Push Button Start

The vehicle has an electronic push button start switch. The power button switch is equipped with two LED's, one for backlighting and one for Vehicle On indication or Vehicle In Service Mode indication. The power button switch light flashes when the driver door is open and the vehicle is not on. The flashing light will eventually time out. The power button switch light is on steady when in Vehicle On or Vehicle In Service Mode. When the vehicle is turned off, the power button switch light will turn off.

Vehicle On

This position is for driving and starting. The Vehicle On mode will be used for service (including maintenance and lubrication) and diagnostics on the electronic propulsion system or the gas engine. With the vehicle off,

transmitter in the vehicle and the brake pedal applied, pressing the power button switch once will place the vehicle in Vehicle On mode. The instrument cluster displays an active fuel or battery gauge, along with an audio startup cue, when the vehicle is ready to be driven. This could take up to 15 s at extremely cold temperatures. The gas engine will only start if needed. If the vehicle did not start, the instrument cluster will display a screen with inactive fuel and battery gauges. The electric propulsion system is active in this power mode. The gas engine will start if the hood is opened while in this power mode. The vehicle can be charged while in this power mode. If the vehicle is left in PARK while in Vehicle On mode and the transmitter is removed from the vehicle, the vehicle will automatically turn off after 1.5 hours. If the vehicle is left in PARK while in Vehicle On mode and the transmitter is in the vehicle, the vehicle will automatically turn OFF after 3 hours. The timer will stop when the vehicle is shifted out of PARK and the timer will reset after the vehicle is placed back in PARK while in Vehicle On mode.

Vehicle In Service Mode

NOTE: **The vehicle will not charge if the charging cable is attached to the vehicle after being placed into the Vehicle In Service Mode. Attach the charging cable to the vehicle before entering the Vehicle In Service Mode to charge the vehicle.**

This power mode is available for service and diagnostics, and to verify the proper operation of the MIL as may be required for emission inspection purposes. The Vehicle In Service Mode will be used for service and diagnostics for items not requiring the electronic propulsion to be active or the operation of the gas engine. With the vehicle off, and the brake pedal not applied, pressing and holding the power button switch for 5 s will place the vehicle in Vehicle In Service Mode for approximately 3 hours. After being in Vehicle In Service Mode for 1.5 hours, the vehicle will look to see if the transmitter is still present. If the transmitter is not present in the vehicle, it will power down instead of staying powered up for the full 3 hours. Pressing and holding the power button switch for at least 10 s will place the vehicle in Vehicle In Service Mode until the vehicle is manually turned OFF. The instruments and audio systems will operate as they do in Vehicle On mode, but the vehicle will not be able to be driven. The electric propulsion system is inactive in this power mode. The gas engine will not start if the hood is opened while in this power mode. The vehicle can only be charged in this power mode if the charging cable is attached before this power mode is enabled.

Vehicle Off

To turn the vehicle off, push the power button switch with the vehicle in P (Park). Retained Accessory Power (RAP) will remain active until the driver door is opened. Refer to [Retained Accessory Power Description and Operation](#) for more information on the retained accessory power function. When turning off the vehicle, if the vehicle is not in P (Park), the SHIFT TO PARK message is displayed in the Driver Information Center (DIC). The electric propulsion system is inactive in this power mode. The gas engine will not start if the hood is opened in this power mode. The vehicle can be charged while in this power mode.

Battery Saver Mode (Transport Mode) (If Equipped)

The battery saver mode (transport mode) reduces the parasitic load of some modules during overseas shipment or during vehicle storage conditions. This improves the drain time on the battery (up to 70 days without the battery going dead). When the vehicle is in transport/storage, some features may have reduced functionality while in the battery saver mode (transport mode), such as disabling the Remote Function Actuator or content theft features.

The battery saver mode (transport mode) incorporates a latching relay that when enabled disconnects some modules from their ignition power or memory power sources. Battery saver mode (transport mode) is initiated by turning on the hazard flashers, applying the brake pedal, and then pushing the power button switch for greater than 15 s. The mode is disengaged by repeating the previous process causing the relay to latch in the

other direction. Once the vehicle is in Vehicle On mode and the hazard flashers are on, pushing the power button switch for greater than 15 s will latch the relay in the other direction. This feature can be used as many times as necessary if the vehicle is to be stored for an extended period of time.

BCM Awake/Sleep States

The BCM is able to control or perform all of the BCM functions in the awake state. The BCM enters the sleep state when active control or normal monitoring of system functions has stopped and a time limit has passed. The BCM must detect certain wake-up inputs before entering the awake state. The BCM monitors for these inputs during the sleep state.

The BCM will enter the awake state if any of the following wake-up inputs are detected:

- Activity on the serial data line (including wake-up circuits)
- Detection of a battery reconnect
- Any door open signal
- Headlamps ON
- Vehicle On
- Vehicle In Service Mode
- Park lamps ON
- Keyless entry or remote start message

The BCM will enter a sleep state when all of the following conditions exist:

- Vehicle Off, transmitter is out of range
- No activity exists on the serial data line (including wake-up circuits)
- No outputs are commanded.
- No delay timers are actively counting.
- No wake-up inputs are present.

If all these conditions are met, the BCM will enter a low power or sleep condition.

Serial Data Wake-Up

Control modules on the serial data wake-up circuit enable or disable communication based on the voltage level of this circuit.

RETAINED ACCESSORY POWER DESCRIPTION AND OPERATION

Fig. 2: 16 Volt Retained Accessory Power System Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K9	K9 Body Control Module
A11	A11 Radio
K73	K73 Telematics Communication Interface Control Module
P2	P2 Transmission Shift Lever Position Indicator
K84	K84 Keyless Entry Control Module
KR76	KR76 Retained Accessory Power Relay

Retained Accessory Power

The body control module (BCM) monitors the vehicle power modes, battery condition, and each door ajar/open switch status to determine whether the retained accessory power should be initiated or terminated. Retained accessory power is controlled by two different methods; relay control and serial data. Some modules receive a retained accessory power message from the BCM over the serial data circuits. Serial data controlled retained accessory power is deactivated as required by their modules retained accessory power mode operation. Other subsystems are activated directly. Components and systems that are active in retained accessory power are also activated anytime the vehicle power mode is any state other than Vehicle OFF regardless of the door switch signals.

Interruptible Retained Accessory Power Relay Controlled Retained Accessory Power

The Keyless entry control module keeps the relay energized during all power modes, except Vehicle Off. The relay is also energized for approximately 10 minutes after moving to the Vehicle OFF state and moving the transmitter out of range, providing no door is opened. The keyless entry control module controls components in

the same manner as BCM direct controlled retained accessory power with one exception; interruptible retained accessory power is deactivated during transmitter authentication. The keyless entry control module will deactivate components that may cause radio frequency (RF) interference when the vehicle On/Off switch is pressed which may result in "NO REMOTE DETECTED" displayed on the driver information center.

Relay controlled retained accessory power will end when one of the following conditions is met:

- The keyless entry control module receives a message that any door ajar or open switch indicating the opening of any door after entering the Vehicle Off state and the transmitter is out of range.

NOTE: If the keyless entry control module is receiving any door ajar or open signal from those switches when the Vehicle Off state is entered and the transmitter is out of range, retained accessory power will not initiate.

-

- The keyless entry control module detects a decrease in battery capacity below a prescribed limit.

Systems powered by the retained accessory power relay during the retained accessory power mode are as follows:

- Accessory Power Receptacle
- Cigarette Lighter Receptacle

Serial Data Controlled Retained Accessory Power

Retained accessory power systems controlled by serial data are as follows:

Radio

Radio retained accessory power activation/termination is the same as relay operation with one exception; the only door switch that will turn off the radio during retained accessory power is the driver door open switch.

Vehicle Communication Interface Module (VCIM) (Onstar®) (If Equipped)

VCIM RAP activation/termination is the same as radio operation with 1 exception; if there is an active call when the ignition key is turned off the VCIM will remain in RAP mode, and keep the radio in RAP mode until the call is terminated.

Low Reference	-	B097B 05*	-	-
Ground	-	1	-	-
1. Vehicle ON/OFF switch indicator always OFF 2. Power mode mismatch * DTC set in keyless entry control module				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicate the vehicle power mode. When the vehicle is in the off mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch up to 10 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors

the s switch located in the vehicle ON/OFF switch. The keyless entry control module also controls the backup power for the ignition run relay through the control circuit by applying voltage to the ignition voltage circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

Conditions for Running the DTC

Control module voltage is 9 - 16 V.

Conditions for Setting the DTC

B097B 00

- The voltage seen at the BCM monitored switch does not match the voltage seen at the keyless entry control module monitored switch.
- The above condition exists for more than 1 s

B097B 02

- The control module detects a short to ground in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 04

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 05

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 08

- The control module detects a change in the ignition mode without observing a switch press
- The above condition occurs 4 consecutive times

B097B 61

- The control module detects a continuously closed vehicle ON/OFF switch
- The above condition exists for more than 1 min

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears after 40 consecutive module ignition cycles without a repeat of the malfunction.

[Circuit/System Verification](#)

1. Verify DTC B097B 61 is not set.
 - **If DTC B097B 61 is set**

Test or replace the S83 Vehicle On/Off Switch.
 - **If DTC B097B 61 is not set**
2. Refer to Circuit/System Testing.

[Circuit/System Testing](#)

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Test for less than 10 Ω between the low reference circuit terminal 7 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K84 Keyless Entry Control Module.

- **If less than 10 Ω**

4. Connect the S83 Vehicle On/Off Switch, Vehicle in Service Mode.

5. Disconnect the S83 Vehicle On/Off Switch.

6. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is greater than 11 V.

- **If 11 V or less**

1. Connect the S83 Vehicle On/Off Switch.

2. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module and S83 Vehicle On/Off Switch.

3. Test for infinite resistance between the signal circuit terminal 6 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If greater than 11 V**

7. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.

8. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is less than 1 V.

- **If 1 V or greater**

1. Disconnect the harness connector at the K9 Body Control Module.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If less than 1 V**

9. Connect the harness connector at the S83 Vehicle On/Off Switch.

10. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 8 - 10 V, with the S83 Vehicle On/Off Switch released.

- **If not between 8 - 10 V**

Test or replace the S83 Vehicle On/Off Switch.

- **If between 8 - 10 V**

11. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 4 - 7 V, with the S83 Vehicle On/Off Switch pressed.

- **If not between 4 - 7 V**

Test or replace the S83 Vehicle On/Off Switch.

- **If between 4 - 7 V**

12. Disconnect the X1 harness connector at the K84 Keyless Entry Control Module.

13. Test for infinite resistance between the signal circuit terminal 11 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

14. Vehicle in Service Mode.

15. Test for less than 1 V between the signal circuit terminal 11 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

16. Test for 4.5 - 5.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch released.

- **If not between 4.5 - 5.5 k Ω**

1. Vehicle OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch.

2. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , test or replace the S83 Vehicle On/Off Switch.

- **If between 4.5 - 5.5 k Ω**

17. Test for 1 - 1.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch pressed.

- **If not between 1 - 1.5 k Ω**

Test or replace the S83 Vehicle On/Off Switch.

- **If between 1 - 1.5 k Ω**

18. Replace the K84 Keyless Entry Control Module.

Component Testing

Ignition Mode Switch Test

1. Vehicle OFF, disconnect the harness connector at the S83 Vehicle ON/OFF Switch.

2. Test for 4.5 - 5.5 k Ω between the terminal listed below with the S83 Vehicle ON/OFF Switch released:

- Signal terminal 6 and ground terminal 4

- Signal terminal 3 and low reference terminal 7

- **If not between 4.5 - 5.5 k Ω**

Replace the S83 Vehicle On/Off Switch.

- **If between 4.5 - 5.5 k Ω**

3. Test for 1 - 1.5k Ω between the terminals listed below with the S83 Vehicle On/Off Switch pressed, :

- Signal terminal 6 and ground terminal 4

- Signal terminal 3 and low reference terminal 7

- **If not between 1 - 1.5 k Ω**

Replace the S83 Vehicle On/Off Switch.

- **If between 1 - 1.5 k Ω**

4. All OK.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - Terminal 3	B097B 02*	B097B 05*	B097B 05*	-
Signal - Terminal 6	2	B097B 04*	2	-
Low Reference	-	B097B 05*	-	-
Ground	-	1	-	-
1. Vehicle ON/OFF switch indicator always OFF 2. Power mode mismatch * DTC set in keyless entry control module				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicate the vehicle power mode. When the vehicle is in the off mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch up to 10 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two

resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors the s switch located in the vehicle ON/OFF switch. The keyless entry control module also controls the backup power for the ignition run relay through the control circuit by applying voltage to the ignition voltage circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

Conditions for Running the DTC

Control module voltage is 9 - 16 V.

Conditions for Setting the DTC

B097B 00

- The voltage seen at the BCM monitored switch does not match the voltage seen at the keyless entry control module monitored switch.
- The above condition exists for more than 1 s

B097B 02

- The control module detects a short to ground in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 04

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 05

- The control module detects an open in the vehicle ON/OFF switch signal circuit
- The above condition exists for more than 1 s

B097B 08

- The control module detects a change in the ignition mode without observing a switch press
- The above condition occurs 4 consecutive times

B097B 61

- The control module detects a continuously closed vehicle ON/OFF switch
- The above condition exists for more than 1 min

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears after 40 consecutive module ignition cycles without a repeat of the malfunction.

Circuit/System Verification

1. Verify DTC B097B 61 is not set.

- **If DTC B097B 61 is set**

Test or replace the S83 Vehicle On/Off Switch.

- **If DTC B097B 61 is not set**

2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**

3. Test for less than 10 Ω between the low reference circuit terminal 7 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.
 - **If less than 10 Ω**
4. Connect the S83 Vehicle On/Off Switch, Vehicle in Service Mode.
5. Disconnect the S83 Vehicle On/Off Switch.
6. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is greater than 11 V.
 - **If 11 V or less**
 1. Connect the S83 Vehicle On/Off Switch.
 2. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module and S83 Vehicle On/Off Switch.
 3. Test for infinite resistance between the signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If greater than 11 V**
7. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
8. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is less than 1 V.
 - **If 1 V or greater**
 1. Disconnect the harness connector at the K9 Body Control Module.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If less than 1 V**
9. Verify the scan tool K84 Keyless Entry Control Module Push Button Ignition Switch Voltage parameter is greater than 11 V.
 - **If 11 V or less**
 1. Connect the S83 Vehicle On/Off Switch.
 2. Vehicle OFF, disconnect the X1 harness connector at the K84 Keyless Entry Control Module and S83 Vehicle On/Off Switch.
 3. Test for infinite resistance between the signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K84 Keyless Entry Control Module.
 - **If greater than 11 V**
10. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.

11. Verify the scan tool K84 Keyless Entry Control Module Push Button Ignition Switch Voltage parameter is less than 1 V.

- **If 1 V or greater**

1. Disconnect the X1 harness connector at the K84 Keyless Entry Control Module.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K84 Keyless Entry Control Module.

- **If less than 1 V**

12. Test or replace the S83 Vehicle On/Off Switch

Component Testing

Ignition Mode Switch Test

1. Vehicle OFF, disconnect the harness connector at the S83 Vehicle ON/OFF Switch.

2. Test for 4.5 - 5.5 k Ω between the terminal listed below with the S83 Vehicle ON/OFF Switch released:

- Signal terminal 6 and ground terminal 4
- Signal terminal 3 and low reference terminal 7
- **If not between 4.5 - 5.5 k Ω**

Replace the S83 Vehicle On/Off Switch.

- **If between 4.5 - 5.5 k Ω**

3. Test for 1 - 1.5k Ω between the terminals listed below with the S83 Vehicle On/Off Switch pressed, :

- Signal terminal 6 and ground terminal 4
- Signal terminal 3 and low reference terminal 7
- **If not between 1 - 1.5 k Ω**

Replace the S83 Vehicle On/Off Switch.

- **If between 1 - 1.5 k Ω**

4. All OK.

DTC B097C: POWER MODE RUN/CRANK INDICATOR CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B097C 02

Power Mode Run/Crank Indicator Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B097C 02	2	1	-
Ground	-	2	-	-
1. Vehicle ON/OFF switch indicator always ON 2. Vehicle ON/OFF switch indicator inoperative				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicates the vehicle power mode. When the vehicle is in the OFF mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch up to 10 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

Conditions for Running the DTC

Control module voltage is 9 - 16 V

Conditions for Setting the DTC

- The BCM detects a short to ground in the control circuit.
- The above condition exists for more than 1 min.

Action Taken When the DTC Sets

The BCM disables the control output.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the module power mode cycle counter reaches 40, without a repeat of the malfunction.

DTC B1370: CONTROL MODULE IGNITION ON AND START CIRCUIT (INSTRUMENT CLUSTER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B1370

Control Module Ignition On and Start Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Instrument Cluster Ignition (Instrument Panel Cluster terminal 8)	B1370 06	B1370 06	B1370 01	-

Circuit/System Description

The vehicle power mode master is the body control module (BCM). The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed. The power mode master will activate relays and other direct outputs of the power mode master as needed according to the calculated power mode.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch.

Conditions for Running the DTC

B1370 01

Vehicle ON.

B1370 06

Vehicle ON, or Vehicle in Service Mode.

Conditions for Setting the DTC

B1370 01

Ignition circuit is shorted to voltage.

B1370 06

- Ignition circuit is open.
- Ignition circuit is shorted to ground.

Action Taken When the DTC Sets

The Instrument Cluster still functions except the malfunction indicator light is always off.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free Vehicle On/Off cycles have occurred.

Circuit/System Verification

1. Verify that DTC B144B is not set.

- **If DTC B144B is set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If DTC B144B is not set**

2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the P16 Instrument Cluster.

2. Verify that a test lamp does not illuminate between the ignition circuit terminal 8 and ground.

- **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.

- **If the test lamp does not illuminate**

3. Vehicle in Service Mode.

4. Verify that a test lamp illuminates between the ignition terminal 8 and ground.

- **If the test lamp does not illuminate and the Ignition fuse is good**

1. Vehicle OFF, remove the test lamp.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , refer to Power Mode Mismatch.

- **If the test lamp does not illuminate and the Ignition fuse is open**

1. Vehicle OFF, remove the test lamp.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the P16 Instrument Cluster.

- **If the test lamp illuminates**

5. Replace the P16 Instrument Cluster.

DTC B144A: RUN POWER RELAY CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B144A

Run Power Relay Circuit

For symptom byte information refer to [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay coil control	B144A 02	-	-	-

Circuit/System Description

The body control module (BCM) feeds the ignition circuit by applying voltage when the vehicle is in Vehicle in Service Mode or Vehicle ON mode.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The DTC can only run when the output is activated.

Conditions for Setting the DTC

The BCM detects a short to ground in the ignition circuit.

Action Taken When the DTC Sets

The module output driver will be shut down and not supply voltage to the ignition circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the module request for the output is removed or the malfunction is no longer present.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K33 HVAC control module.
2. Connect a test lamp between the ignition circuit terminal 9 and ground.
3. Verify the test lamp turns ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
- **If the test lamp turns ON and OFF**
4. Test or replace the K33 HVAC control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Control Module References](#) for body control module and HVAC control module replacement, programming and setup.

DTC B144B: RUN/CRANK POWER RELAY CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B144B

Run/Crank Power Relay Circuit

For symptom byte information refer to [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B144B 02*	B144B 04*	B144B 01*	-
Control	B144B 02**	1	2	-
1. No start 2. Engine will continue to run after the ignition is turned OFF * DTC set in keyless entry control module ** DTC set in BCM				

Circuit/System Description

The body control module (BCM) controls the ignition main relay through the control circuit by applying voltage to the ignition main relay coil control circuit. The ignition main relay is energized when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested. This is part of the BCM's primary function in controlling the vehicle power mode.

The keyless entry control module controls the backup power for the ignition main relay through the control circuit by applying voltage to the ignition circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

Conditions for Running the DTC

System voltage is greater than 9 V

Conditions for Setting the DTC

B144B 01

The ignition output is not active and a short to battery is detected 3 consecutive times on the ignition voltage circuit

B144B 02 - BCM

A short to ground is detected on the ignition main relay coil control circuit

B144B 02 - Keyless Entry Control Module

The ignition output is active and a short to ground is detected 3 consecutive times on the ignition voltage circuit

B144B 04

The ignition output is not active and an open is detected 20 consecutive times on the ignition voltage circuit

Action Taken When the DTC Sets

B144B 01, B144B 04

No action is taken

B144B 02

The ignition relay is deactivated when the fault is set. After 100 ms, the ignition main relay will be activated. If the fault is still set, the relay will be deactivated. The ignition main relay will again be activated after 100 ms. If this also results in a fault, the ignition main relay will be deactivated until a new ignition request is received.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present and an ignition request is received.
- A history DTC will clear after 40 malfunction-free ignition cycles.

Diagnostic Aids

A short to voltage on the ignition main relay coil control will cause the engine to remain running after the vehicle mode is changed to OFF.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the KR73 Ignition Main Relay clicks ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.
 - **If the KR73 Ignition Main Relay does not click ON and OFF**

Refer to Circuit/System Testing.
 - **If the KR73 Ignition Main Relay clicks ON and OFF**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
2. Test for less than 1 V between the ignition circuit terminal 6 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.
 - **If the test lamp illuminates**

5. Vehicle OFF, connect the X3 harness connector at the K9 Body Control Module.
6. Vehicle OFF and all vehicle systems OFF, disconnect the KR73 Ignition Main Relay. It may take up to 2 min for all vehicle systems to power down.
7. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
8. Connect a test lamp between the control circuit terminal 2 and the ground circuit terminal 1.
9. Verify the test lamp turns ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
10. Test or replace the KR73 Ignition Main Relay.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Control Module References](#) for control module replacement, programming and setup.

DTC B1451: ACCESSORY POWER CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B1451

Accessory Power Circuit

For symptom byte information refer to [Symptom Byte List](#)

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	B1451 02	B1451 04	B1451 01	-

Circuit/System Description

The keyless entry control module provides backup controls for the ignition power circuit, through the control circuit, by applying voltage to the circuit. The ignition power circuit is energized when the vehicle power mode is in Vehicle ON or Vehicle in Service Mode.

Conditions for Running the DTC

B1451 01, B1451 04

- Vehicle power mode is Vehicle OFF
- Module is awake
- DTC B1451 not already set
- System voltage between 6 and 16 V

B1451 02

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode
- Module is awake
- The DTC is only run when the output is active
- DTC B1451 is not already set
- System voltage between 6 and 16 V

Conditions for Setting the DTC

B1451 01

Ignition output is not active and a short to battery is detected 3 consecutive times.

B1451 02

Ignition output is active and a short to ground is detected 3 consecutive times.

B1451 04

Ignition output is not active and an open circuit is detected 20 consecutive times.

Action Taken When the DTC Sets

B1451 02

The ignition output is deactivated when a short to ground is detected. After 100 ms the output is activated again. This happens 3 times and then the output is deactivated until a new Vehicle ON or Vehicle in Service Mode request is received.

B1451 01, B1451 04

No action is taken.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present during a DTC check.
- A history DTC clears when the module power mode cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Diagnostic Aids

- A short to voltage in the ignition control circuit will keep the vehicle modules awake, which can drain the vehicle's battery.
- A short to ground in the extension of this circuit through the body control module can back feed to the keyless entry control module. Check for a short to ground on the ignition circuit on the other side of the ignition pass thru, in the body control module, before replacing the body control module.

Circuit/System Verification

1. Verify DTC U1814 is not set.
 - **If DTC U1814 is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#).

- **If DTC U1814 is not set**

2. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle in Service Mode, disconnect the X2 harness connector at the K84 Keyless Entry Control Module.
2. Verify that a test lamp illuminates between B+ circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K84 Keyless Entry Control Module.

- **If the test lamp illuminates**

3. Vehicle OFF, connect the X2 harness connector at the K84 Keyless Entry Control Module and disconnect the X3 harness connector at the K9 Body Control Module.
4. Test for less than 1 V between the ignition circuit terminal 5 and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

5. Vehicle in Service Mode.
6. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate**

1. Vehicle OFF. remove the test lamp.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.

- **If the test lamp illuminates**

7. Replace the K9 Body Control Module.

Repair Instructions

Control Module References for the body control module and keyless entry control module replacement, programming and setup.

DTC B305E: INTERRUPTIBLE RAP RELAY CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B305E

Interruptible RAP Relay Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Coil Control	B305E 02	B305E 05	B305E 01, B305E 05	-

Circuit/System Description

The keyless entry control module controls the retained accessory power relay through the control circuit by applying voltage to the interruptible retained accessory power relay coil control circuit. The retained accessory power relay is energized when the ignition is in the Vehicle In Service Mode or the Vehicle On mode. The relay is also energized for approximately 10 min after shutting the vehicle OFF, providing no door is opened

Conditions for Running the DTC

- System voltage is greater than 6 V.
- The DTC can only set when the output is actively being requested by the module.

Conditions for Setting the DTC

B305E 01

The ignition output is not active and a short to battery is detected 3 consecutive times on the ignition voltage circuit.

B305E 02

The ignition output is active and a short to ground is detected on the ignition voltage circuit.

B305E 05

The ignition output is active and an open or short to battery is detected on the ignition voltage circuit.

Action Taken When the DTC Sets

B305E 01, B305E 05

No action is taken.

B305E 02

The module output driver will be shut down and not supply voltage to the circuit.

Conditions for Clearing the DTC

- The current DTC will clear when the malfunction is no longer present and the ignition output is active.
- A history DTC clears when the module ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

DTC P15B9 OR P15BA: ELECTRIC A/C COMPRESSOR CONTROL MODULE IGNITION ON/START SWITCH CIRCUIT VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P15B9

Electric A/C Compressor Control Module Ignition On/Start Switch Circuit Low Voltage

DTC P15BA

Electric A/C Compressor Control Module Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Electric A/C compressor control module ignition	P15B9	P15B9	P15BA	-

Circuit/System Description

The body control module (BCM) controls the ignition main relay by applying voltage to the run/crank coil control circuit. The ignition circuit is energized when the vehicle power mode is Vehicle ON or Vehicle in Service Mode. The hybrid powertrain control module 2 receives the power mode status from the A/C compressor over serial data and compares this status to its own internal power mode status.

Conditions for Running the DTC

P15B9

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Hybrid powertrain control module 2 is awake.
- DTC's P2534, P2535, or U016B is not set.
- System voltage greater than 10.2 V.

P15BA

- Vehicle power mode is Vehicle OFF.
- Hybrid powertrain control module 2 is awake.
- DTC's P2534, P2535, or U016B is not set.
- System voltage greater than 10.2 V.

Conditions for Setting the DTC

P15B9

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode.
- Hybrid powertrain control module 2 ignition input is active.
- A/C compressor ignition input is not active for more than 2 s.

P15BA

- Vehicle power mode is Vehicle OFF.
- Hybrid powertrain control module 2 is awake.
- Hybrid powertrain control module 2 ignition input is not active.
- A/C compressor ignition input is active for more than 2 s

Action Taken When the DTC Sets

P15B9, P15BA

DTCs P15B9 and P15BA are type B DTCs.

Conditions for Clearing the DTC

P15B9 or P15BA

DTCs P15B9 and P15BA, are type B DTCs.

Diagnostic Aids

A short to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disconnect the X1 harness connector at the G1 A/C Compressor.

2. Verify that a test lamp does not illuminate between the ignition circuit terminal 3 and ground.

- **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.

- **If the test lamp does not illuminate**

3. Vehicle in Service Mode

4. Verify a test lamp illuminates between the ignition circuit terminal 3 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , refer to [Power Mode Mismatch](#).
- **If the test lamp does not illuminate and the circuit fuse is open**
1. Vehicle OFF, disconnect the harness connector at the G1 A/C Compressor and all devices that share the same ignition circuit.
2. Test for infinite resistance between the ignition circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Connect each of the devices one at a time and test for greater than 10 Ω between the ignition circuit terminal 3 and ground.
 - If 10 Ω or less, disconnect the appropriate device and retest to verify if the short is in the circuit or the component.
 - If greater than 10 Ω replace the appropriate device.
- **If the test lamp illuminates**
5. Replace the G1 A/C Compressor.

DTC P1A60: BATTERY ENERGY CONTROL MODULE IGNITION ACCESSORY SWITCH CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P1A60

Battery Energy Control Module Ignition Accessory Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Serial Data Wake-Up	P1A60, P06E4,	P1A60	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
	U1814, U2099			

Circuit/System Description

The hybrid powertrain control module 2 sends the serial data wake-up power mode status in a serial data message to the battery energy control module. The hybrid powertrain control module 2 also powers up the serial data wake-up circuit to the battery energy control module when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

Conditions for Running the DTC

- Vehicle power mode is Vehicle ON or Vehicle in Service Mode
- Battery energy control module is awake
- System voltage greater than 9 V

Conditions for Setting the DTC

Ignition input is active, and 500 ms after the ignition input transitions high, a voltage below 5 V is detected 3 consecutive times

Action Taken When the DTC Sets

DTC P1A60 is a type B DTC.

Conditions for Clearing the DTC

DTC P1A60 is a type B DTC.

Diagnostic Aids

A short to voltage in the serial data wake-up circuit will keep the vehicle bus awake, which can drain the vehicle's battery.

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the A4 Hybrid/EV Battery Pack. Refer to [High Voltage Disabling](#)

2. Connect the 12 V battery, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
3. Connect a test lamp between the serial data wake-up circuit terminal 5 and ground.
4. Verify the test lamp turns ON and OFF when cycling the S39 Ignition Mode Switch between Vehicle in Service Mode and Vehicle OFF.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 2 Ω in the serial data wake-up circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
 2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
 - **If the test lamp turns ON and OFF**
5. Vehicle OFF, remove the A4 Hybrid/EV Battery Pack cover. Refer to [High Voltage Battery Cover Replacement](#)
6. Connect the **EL-50211** low voltage jumper harness extension.
7. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
8. Connect a test lamp between the serial data wake-up circuit terminal 3 and ground.
9. Verify the test lamp turns ON and OFF when cycling the S39 Ignition Mode Switch between Vehicle in Service Mode and Vehicle OFF.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, disconnect the **EL-50211** low voltage jumper harness extension.
 2. Test for less than 2 Ω in the serial data wake-up circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - **If the test lamp is always ON**
 1. Vehicle OFF, disconnect the **EL-50211** low voltage jumper harness extension.
 2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - **If the test lamp turns ON and OFF**
10. Replace the K16 Battery Energy Control Module.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P2534

Ignition On/Start Switch Circuit Low Voltage

DTC P2535

Ignition On/Start Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P2534	P2534	P2535	-

Circuit/System Description

The body control module (BCM) controls the ignition relay through the control circuit by applying voltage to the circuit. The ignition circuit is energized when the vehicle power mode is Vehicle ON or Vehicle in Service Mode.

Conditions for Running the DTC

P2534, P2535

The control module is awake.

Conditions for Setting the DTC

P2534

The control module detects 2 V or less on the ignition voltage circuit.

P2535

The control module detects greater than 5 V or greater on the ignition voltage circuit, with the ignition turned OFF.

Action Taken When the DTC Sets

P2534, P2535

DTCs P2534 and P2535 are type A DTCs.

Conditions for Clearing the DTC

P2534, P2535

DTCs P2534 and P2535 are type A DTCs.

Diagnostic Aids

A short to voltage in the ignition circuit will keep the vehicle modules awake, which can drain the vehicle's battery.

Circuit/System Testing

For European Regions

WARNING: High voltage enabling and disabling shall be only performed by High Voltage Qualified Technicians. The procedures for high voltage enabling/disabling can be found in the service instructions and must be strictly followed at all times. The usage of the Protocol High Voltage Disabling / Enabling is mandatory. The High Voltage Qualified Technician is responsible for the adherence to the

manufacturer's service instructions as well as current national legal regulations.

Failure to follow the procedures exactly as written may result in serious injury or death.

Questions regarding training can be answered by your national training center.

WARNING: Any hybrid/EV battery pack replacement shall be performed by High Voltage Qualified Technicians only. The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior removal of the battery pack.

For Non-European Regions

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedures may result in serious injury or death.

1. Vehicle OFF and all vehicle systems off, disconnect the harness connector at the control module setting the DTC.
2. Verify that a test lamp does not illuminate between the ignition circuit and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.

- **If the test lamp does not illuminate**

3. Vehicle in Service Mode.

4. Verify a test lamp illuminates between the ignition circuit and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , refer to [Power Mode Mismatch](#)

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the control module setting the DTC.

- **If the test lamp illuminates**

5. Replace the control module setting the DTC.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for the appropriate control module replacement, programming and setup.

DTC P2537: IGNITION ACCESSORY SWITCH CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P2537

Ignition Accessory Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P2537, P06E4, U1814, U2099	P2537	-	-

Circuit/System Description

The control module continuously monitors the voltage on the ignition accessory circuit every 0.1s. Higher or lower than normal voltage may cause erratic vehicle operation.

Conditions for Running the DTC

P2537

Propulsion system is active for 5 s.

Conditions for Setting the DTC

P2537

The device detects the accessory voltage circuit is open for 0.1 s.

Action Taken When the DTC Sets

P2537

P2537 is a Type B DTC.

Conditions for Clearing the DTC

P2537

P2537 is a Type B DTC.

Diagnostic Aids

Short to ground may set multiple no communication codes for high speed GMLAN devices.

Hybrid/EV Powertrain Control Module 2 Circuit Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module
2.

2. Vehicle in Service Mode.

3. Verify a test lamp illuminates between the accessory wake up serial data circuit terminal 67 and ground.

- **If the test lamp does not illuminate.**

1. Ignition OFF remove the test lamp, disconnect the X4 connector at the K9 Body Control Module.

2. Test for less than 2 Ω on the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If the test lamp illuminates**

4. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Engine Control Module Circuit Malfunction

1. Vehicle OFF and all vehicle systems off, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Vehicle in Service Mode.
3. Verify a test lamp illuminates between the Accessory Wake up Serial Data 2 circuit terminal 13 and ground.

- **If the test lamp does not illuminate**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the KR114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 2 Ω on the Accessory Wake up Serial Data 2 circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the KR114B Hybrid/EV Powertrain Control Module 2.

- **If the test lamp illuminates**

4. Replace the control module setting the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

SYMPTOMS - WIRING SYSTEMS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
 - There are no DTCs set.
 - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to:
 - **Power Mode Description and Operation**
 - **Retained Accessory Power Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories**.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections**.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [Power Mode Mismatch](#)
- [Retained Accessory Power Malfunction](#)
- [Vehicle ON/OFF Switch Indicator Malfunction](#)
- [Vehicle Will Not Change Power Mode](#)

IGNITION CAN/CANNOT BE TURNED OFF WITH TRANSMISSION IN ANY GEAR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	2	1	-	-
Ground	-	1	-	-
1. Ignition will not turn to OFF with vehicle in park 2. Ignition will turn to OFF with vehicle out of park				

Circuit/System Description

The electronic park lock system purpose is to prevent the ignition from being switched to the OFF position when the transmission shift lever is in any position other than Park and the vehicle may still be moving. The electronic park lock system incorporates the park position switch that located in the shift lock control switch. When the transmission shift lever is in Park, the park position switch closes and the BCM allows the ignition to be turned OFF.

If the vehicle is not in Park, the ignition will turn to ACC/ACCESSORY and display the message SHIFT TO PARK in the Driver Information Center. When the vehicle is shifted into Park, the ignition system will switch to OFF.

Diagnostic Aids

Verify that the transmission shift selector indicator matches the position of the gear shift lever while selecting between the Park, Reverse, Drive and Low positions.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Body Control Module In Park Switch Status parameter changes between On and Off when shifting the S3 Transmission Shift Lever in and out of Park.
 - **If the parameter does not change**

Refer to Circuit/System Testing.
 - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Body Control Module In Park Switch Status parameter is Off.
 - **If not Off**
 1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit terminal 6 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K9 Body Control Module.
 - **If Off**
5. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the ground circuit terminal 2.
6. Verify the scan tool Body Control Module In Park Switch Status parameter is On.
 - **If not On**
 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K9 Body Control

Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
- **If On**
7. Test or replace the S3 Transmission Shift Lever.

POWER MODE MISMATCH

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

The body control module (BCM) controls the ignition main relay by applying voltage to the run/crank relay coil control circuit. The ignition main relay is energized when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

The keyless entry control module controls the retained accessory power relay by applying voltage to the interruptible retained accessory power relay coil control circuit. The retained accessory power relay is energized during all power modes, except OFF-awake. The relay is also energized for approximately 10 min after shutting the vehicle OFF providing, no door is opened and during transmitter authentication. The keyless entry control module will deactivate components that may cause radio frequency (RF) interference when the vehicle on/off switch is pressed which may result in NO REMOTE DETECTED displayed on the driver information center.

The engine control module (ECM) controls the engine controls ignition relay by applying voltage to the engine controls relay control circuit.

The replacement procedure can be found in the service instruction and must be strictly followed at all times. The High Voltage Qualified Technician is responsible for adherence to the manufacturer's service instructions as well as current national legal regulations. If the hybrid/EV battery pack needs to be replaced contact the Technical Assistance Centre for further instructions prior removal of the battery pack.

Diagnostic A

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR73 Ignition Main Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate**

Replace the X50A Fuse Block - Underhood
 - **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 2 and the ground circuit terminal 1.
6. Verify the test lamp turns ON and OFF when commanding the Run/Crank Relay On and Off with a scan tool.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance.
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If the test lamp turns ON and OFF**
 7. Verify that a test lamp does not illuminate between the ignition circuit terminal 5 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.
 - **If the test lamp does not illuminate**
 8. Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 3 and the ignition circuits listed below.
 - Ignition circuit terminal 4
 - Ignition circuit terminal 5
 9. Verify the device is activated.
 - **If the device does not activate**
 1. Vehicle OFF, disconnect the harness connector at the device.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the device.
 - **If the device activates**
 10. Test or replace the KR73 Ignition Main Relay.

Diagnostic B

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR75 Engine Controls Ignition Relay, Vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate**

Replace the X50A Fuse Block - Underhood
 - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.

- **If the test lamp does not illuminate**

Replace the X50A Fuse Block - Underhood

- **If the test lamp illuminates**

4. Connect a test lamp between the B+ circuit terminal 1 and the control circuit terminal 2.
5. Verify the test lamp turns ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF.

- **If the test lamp is always OFF**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 engine control module, Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

- **If the test lamp is always ON**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 engine control module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 engine control module.

- **If the test lamp turns ON and OFF**

6. Verify that a test lamp does not illuminate between the ignition circuit terminal 5 and ground.

- **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.

- **If the test lamp does not illuminate**

7. Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 3 and the ignition circuit terminal 5.
8. Verify device is activated.

- **If the device does not activate**

1. Vehicle OFF, disconnect the harness connector at the device.
2. Test for infinite resistance between the ignition circuit terminal 87 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the device.

- **If the device activates**

9. Test or replace the KR75 Engine Controls Ignition Relay.

Diagnostic C

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR76 Retained Accessory Power Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
 - **If the test lamp does not illuminate**

Replace the X51A Fuse Block - Instrument Panel

- **If the test lamp illuminates**
5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.
 6. Verify the test lamp turns ON and OFF when cycling the between Vehicle in Service Mode and Vehicle OFF.
 - **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.
 - **If the test lamp is always ON**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.
 - **If the test lamp turns ON and OFF**
 7. Verify that a test lamp does not illuminate between the ignition circuit terminal 87 and ground.
 - **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.

- **If the test lamp does not illuminate**

8. Vehicle in Service Mode, connect a 40 A fused jumper wire between the B+ circuit terminal 30 and the ignition circuit terminal 87.

9. Verify device is activated.

- **If the device does not activate**

1. Vehicle OFF, disconnect the harness connector at the device.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance

3. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the device.

- **If the device activates**

10. Test or replace the KR76 Retained Accessory Power Relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the appropriate relay.

2. Test for 70 - 150 Ω between terminals (85 or 1) and (86 or 2).

- **If less than 70 or greater than 150 Ω**

Replace the relay.

- **If between 70 - 150 Ω**

3. Test for infinite resistance between the terminals listed below:

- (30 or 3) and (86 or 2)

- (30 or 3) and (87 or 5)

- (30 or 3) and (85 or 1)

- (85 or 1) and (87 or 5)

- (86 or 2) and (87 or 5)

- **If less than infinite resistance**

Replace the relay.

- **If infinite resistance**

4. Install a 3 A fused jumper wire between relay terminal (85 or 1) and 12 V. Install a jumper wire between relay terminal (86 or 2) and ground.

5. Test for less than 5.0 Ω between terminals (30 or 3) and (87 or 5).

- **If 5.0 Ω or greater**

Replace the relay.

- **If less than 5.0 Ω**

6. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay Switch B+	1	1	1	-
Relay Switch Ignition	1	1	1, 2	-
Relay Coil Control	B305E 02	B305E 05	B305E 01, B305E 05	-
Relay Coil Ground	-	B305E 05	-	-
Ground	-	1	-	-
1. Retained accessory power malfunction 2. Retained accessory power relay always ON				

Circuit/System Description

The keyless entry control module controls the retained accessory power relay by applying voltage to the interruptible retained accessory power relay coil control circuit. The retained accessory power relay is energized during all power modes, except OFF-awake. The relay is also energized for approximately 10 min after shutting the vehicle OFF providing, no door is opened and during transmitter authentication. The keyless entry control module will deactivate components that may cause radio frequency (RF) interference when the vehicle on/off switch is pressed which may result in NO REMOTE DETECTED displayed on the driver information center.

Circuit/System Verification

NOTE: Use schematics to determine which devices are controlled by the KR76 Retained Accessory Power Relay. Use the connector end view to identify the ignition circuit terminal for each of those devices.

1. Ignition ON.
2. Verify the appropriate devices controlled by the KR76 Retained Accessory Power Relay turn ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in Service Mode and Vehicle OFF with the door open.

- **If the devices do not turn ON and OFF**

Refer to Circuit/System Testing

- **If the devices turn ON and OFF**

3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR76 Retained Accessory Power Relay. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 85 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.

- **If the test lamp does not illuminate**

Replace the X51A Fuse Block - Instrument Panel

- **If the test lamp illuminates**

5. Connect a test lamp between the control circuit terminal 86 and the ground circuit terminal 85.

6. Verify the test lamp turns ON and OFF when cycling the S83 vehicle ON/OFF switch between Vehicle in

Service Mode and Vehicle OFF with the door open.

- **If the test lamp is always OFF**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K84 Keyless Entry Control Module, Vehicle in Service Mode.
2. Test for less than 1 V between the ignition circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K84 Keyless Entry Control Module.

- **If the test lamp turns ON and OFF**

7. Connect the KR76 Retained Accessory Power Relay.
 8. Disconnect the appropriate X80 Accessory Power Receptacle or T22 Mobile Device Wireless Charger Module.
 9. Vehicle OFF.
 10. Verify that a test lamp does not illuminate between each of the ignition circuits listed below and ground.
 - X80H Accessory Power Receptacle - Center Console - Ignition circuit terminal A
 - X80L Accessory Power Receptacle - Center Console Rear - Ignition circuit terminal A
 - T22 Mobile Device Wireless Charger Module - Ignition circuit terminal 1
- **If the test lamp illuminates**

Repair the short to voltage on the ignition circuit.

- **If the test lamp does not illuminate**

11. Vehicle in Service Mode.
 12. Verify that a test lamp illuminates between each of the ignition circuits listed below and ground.
 - X80H Accessory Power Receptacle - Center Console - Ignition circuit terminal A
 - X80L Accessory Power Receptacle - Center Console Rear - Ignition circuit terminal A
 - T22 Mobile Device Wireless Charger Module - Ignition circuit terminal 1
- **If the test lamp does not illuminate and the circuit breaker or fuse is good**
1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the K84 Keyless Entry Control Module.
- **If the test lamp does not illuminate and the circuit breaker or fuse is open**
1. Vehicle OFF, remove the test lamp.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test or replace the appropriate X80 Accessory Power Receptacle or T22 Mobile Device Wireless Charger Module.

• **If the test lamp illuminates**

13. Test or replace the appropriate X80 Accessory Power Receptacle or T22 Mobile Device Wireless Charger Module.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR76 Retained Accessory Power Relay.

2. Test for 70 - 150 Ω between terminals 85 and 86.

- **If less than 70 or greater than 150 Ω**

Replace the relay.

- **If between 70 - 150 Ω**

3. Test for infinite resistance between the following terminals:

- 30 and 86
- 30 and 87
- 30 and 85
- 85 and 87

- **If less than infinite resistance**

Replace the relay.

- **If infinite resistance**

4. Test for less than 5.0 Ω between terminals 30 and 87.

- **If 5.0 Ω or greater**

Replace the relay.

- **If less than 5.0 Ω**

5. Install a 3 A fused jumper wire between relay terminal 41 and 12 V. Install a jumper wire between relay terminal 40 and ground.

6. Test for less than 5.0 Ω between terminals 30 and 87.

- **If 5.0 Ω or greater**

Replace the relay.

- **If less than 5.0 Ω**

7. All OK

VEHICLE ON/OFF SWITCH INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	B097C 02	2	1	-
Ground	-	2	-	-
1. Vehicle ON/OFF switch indicator always ON 2. Vehicle ON/OFF switch indicator inoperative				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicates the vehicle power mode. When the vehicle is in the OFF mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch for at least 5 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains two individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through two resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch.

Circuit/System Verification

1. Verify the blue LED illuminates when the S83 Vehicle ON/OFF Switch is pressed and held for at least 5 s, with the brake pedal released.

- **If the blue LED does not illuminate**

Refer to Circuit/System Testing.

- **If the blue LED illuminates**

2. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle ON/OFF Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 4 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Test for less than 1 V between the control circuit terminal 5 and ground.

- **If 1 V or greater**

1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V

3. Test for less than 2 Ω in control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.

- **If less than 1 V**

4. Vehicle OFF, connect the harness connector at the S83 Vehicle ON/OFF Switch.
5. Vehicle in Service Mode, disconnect the harness connector at the S83 Vehicle ON/OFF Switch.

6. Verify a test lamp illuminates between the control circuit terminal 5 and ground.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If the test lamp illuminates**
7. Test or replace the S83 Vehicle ON/OFF Switch.

Component Testing

1. Vehicle OFF, disconnect the harness at the S83 Vehicle ON/OFF Switch.
2. Connect a jumper wire between the S83 Vehicle ON/OFF Switch terminal 4 and ground.
3. Connect a 3 A fused jumper wire between the S83 Vehicle ON/OFF Switch terminal 5 and B+.
4. Verify the blue LED illuminates.
 - **If the LED does not illuminate**

Replace the S83 vehicle ON/OFF switch.
 - **If the LED illuminates**
5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal - Terminal 3	B097B 02*	B097B 05*	B097B 05*	-
Signal - Terminal 6	2	B097B 05*	2	-
Low Reference	-	B097B 05*	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ground	-	1	-	-
1. Vehicle ON/OFF Switch Indicator Always Off 2. Power Mode Mismatch * DTC set in keyless entry control module				

Circuit/System Description

The vehicle ON/OFF switch has a single LED that indicate the vehicle power mode. When the vehicle is in the off mode, the LED is not illuminated. Pressing and holding the vehicle ON/OFF switch for up to 10 s, without the brake pedal applied, will enter the Vehicle Service Mode and the blue LED will illuminate. With the vehicle OFF and the brake pedal applied, pressing the vehicle ON/OFF switch once, the vehicle will enter the Vehicle ON mode and the blue LED will illuminate.

The vehicle ON/OFF switch contains 2 individual switches that provides redundant switch inputs to both the body control module (BCM) and the keyless entry control module. The BCM supplies the vehicle ON/OFF switch a constant B+ signal. The BCM monitors this signal to determine if the switch is released or pressed. When the vehicle ON/OFF switch is not pressed, voltage on the signal circuit is pulled down through 2 resistors in the switch. When the vehicle ON/OFF switch is pressed, voltage on the signal circuit is pulled down through only one resistor, changing the voltage seen at the BCM and indicating that the vehicle ON/OFF switch is pressed.

The keyless entry control module monitors voltage on the switch in the same manner as the BCM, but monitors the second switch located in the vehicle ON/OFF switch. The keyless entry control module also controls the backup power for the ignition run relay through the control circuit by applying voltage to the ignition voltage circuit. This circuit is a pass-thru in the BCM and will energize the ignition circuit when the vehicle is in Service Mode, the vehicle is ON, or when a remote start is requested.

Control Module References for scan tool information

Circuit/System Verification

1. Verify DTC B097B 08 or B097B 61 is not set.
 - **If either DTC is set**

Test or replace the S83 Vehicle On/Off Switch.
 - **If the DTCs are not set**
2. Verify the blue LED illuminates when the S83 Vehicle On/Off Switch is pressed and held for up to 10 s, with the brake pedal released.
 - **If the blue LED does not illuminate**

Refer to Circuit/System Testing.
 - **If the blue LED illuminates**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
3. Test for less than 10 Ω between the low reference circuit terminal 7 and ground.
 - **If 10 Ω or greater**
 1. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K84 Keyless Entry Control Module.
 - **If less than 10 Ω**
4. Connect the S83 Vehicle On/Off Switch, Vehicle in Service Mode.
5. Disconnect the S83 Vehicle On/Off Switch.
6. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is greater than 11 V.
 - **If 11 V or less**
 1. Connect the S83 Vehicle On/Off Switch.
 2. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module and S83 Vehicle On/Off Switch.
 3. Test for infinite resistance between the signal circuit terminal 6 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K9 Body Control Module.

- **If greater than 11 V**

7. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.

8. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is less than 1 V.

- **If 1 V or greater**

1. Disconnect the harness connector at the K9 Body Control Module.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Test for less than 2 Ω in signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

- **If less than 1 V**

9. Connect the harness connector at the S83 Vehicle On/Off Switch.

10. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 8 - 10 V, with the S83 Vehicle On/Off Switch released.

- **If not between 8 - 10 V**

Test or replace the S83 Vehicle On/Off Switch.

- **If between 8 - 10 V**

11. Verify the scan tool K9 Body Control Module Push Button Ignition Switch Voltage parameter is 4 - 7 V, with the S83 Vehicle On/Off Switch pressed.

- **If not between 4 - 7 V**

Test or replace the S83 Vehicle On/Off Switch.

- **If between 4 - 7 V**

12. Disconnect the X1 harness connector at the K84 Keyless Entry Control Module.

13. Test for infinite resistance between the signal circuit terminal 11 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

14. Vehicle in Service Mode.

15. Test for less than 1 V between the signal circuit terminal 11 and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

16. Test for 4.5 - 5.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with

the S83 Vehicle On/Off Switch released.

- **If not between 4.5 - 5.5 k Ω**

1. Vehicle OFF, disconnect the harness connector at the S83 Vehicle On/Off Switch.
2. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , test or replace the S83 Vehicle On/Off Switch.

- **If between 4.5 - 5.5 k Ω**

17. Test for 1 - 1.5 k Ω between the signal circuit terminal 11 and the low reference circuit terminal 12, with the S83 Vehicle On/Off Switch pressed.

- **If not between 1 - 1.5 k Ω**

Test or replace the S83 Vehicle On/Off Switch.

- **If between 1 - 1.5 k Ω**

18. Replace the K84 Keyless Entry Control Module.

Component Testing

Ignition Mode Switch Test

1. Vehicle OFF, disconnect the harness connector at the S83 vehicle ON/OFF switch.
2. With the S83 vehicle ON/OFF switch released, test for 4.5 - 5.5 k Ω between the terminal listed below:
 - Signal terminal 6 and ground terminal 4
 - Signal terminal 3 and low reference terminal 7
 - **If not between 4.5 - 5.5 k Ω**

Replace the S83 Vehicle On/Off Switch.

- **If between 4.5 - 5.5 k Ω**

3. With the S83 Vehicle On/Off Switch pressed, test for 1 - 1.5k Ω between the terminals listed below:
 - Signal terminal 6 and ground terminal 4
 - Signal terminal 3 and low reference terminal 7
 - **If not between 1 - 1.5 k Ω**

Replace the S83 Vehicle On/Off Switch.

- **If between 1 - 1.5 k Ω**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ignition and Start Switch Replacement**
- **Control Module References** for the appropriate control module replacement, programming and setup.

GENERAL ELECTRICAL DIAGNOSIS

Basic Knowledge Required

Without a basic knowledge of electricity, it will be difficult to use the diagnostic procedures contained in the service manual. You should understand the basic theory of electricity, and know the meaning of voltage (V), current (A), and resistance (Ω). You should also be able to read and understand a wiring diagram, as well as understand what happens in a circuit with an open or a shorted wire.

CHECKING AFTERMARKET ACCESSORIES

WARNING: Refer to [SIR Warning](#) .

Do not connect aftermarket accessories into the SIR circuits, all such circuits are indicated on circuit diagrams with the SIR symbol.

Always check for aftermarket accessories (non-OEM) as the first step in diagnosing electrical problems. If the vehicle is so equipped, disconnect the system to verify that these add-on accessories are not the cause of the problems.

Possible causes of vehicle problems related to aftermarket accessories include:

- Power feeds connected to points other than the battery
- Antenna location
- Transceiver wiring located too close to vehicle electronic modules or wiring
- Poor shielding or poor connectors on antenna feed line
- Check for recent service bulletins detailing installation guidelines for aftermarket accessories.

CIRCUIT TESTING

The Circuit Testing section contains the following diagnostic testing information. Using this information along with the diagnostic procedures will identify the cause of the electrical malfunction.

- [Using Connector Test Adapters](#)
- [Probing Electrical Connectors](#)
- [Troubleshooting with a Digital Multimeter](#)
- [Troubleshooting with a Test Lamp](#)
- [Using Fused Jumper Wires](#)
- [Measuring Voltage](#)
- [Measuring Voltage Drop](#)
- [Measuring Frequency](#)
- [Testing Ground and Low Reference Circuits](#)
- [Testing for Continuity](#)
- [Testing for Short to Ground](#)
- [Testing for a Short to Voltage](#)
- [Testing for Intermittent Conditions and Poor Connections](#)
- [Inducing Intermittent Fault Conditions](#)
- [Testing for Electrical Intermittents](#)
- [Scan Tool Snapshot Procedure](#)

- [Circuit Protection - Fuses](#)
- [Circuit Protection - Circuit Breakers](#)
- [Circuit Protection - Fusible Links](#)

USING CONNECTOR TEST ADAPTERS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

CAUTION: Do not insert test equipment probes (DMM etc.) into any connector or fuse block terminal. The diameter of the test probes will deform most terminals. A deformed terminal will cause a poor connection, which will result in a system failure. Always use the J-35616-F GM Approved Terminal Release Tool Kit in order to front probe terminals. Do not use paper clips or other substitutes to probe terminals.

When using the J-35616-F GM Approved Terminal Release Tool Kit, ensure the terminal test adapter choice is the correct size for the connector terminal. Do not visually choose the terminal test adapter because some connector terminal cavities may appear larger than the actual terminal in the cavity. Using a larger terminal test adapter will damage the terminal. Refer to the J-35616-F GM Approved Terminal Release Tool Kit label on the inside of the J-35616-F GM Approved Terminal Release Tool Kit for the correct adapter along with the connector end view for terminal size.

PROBING ELECTRICAL CONNECTORS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: Always be sure to reinstall the connector position assurance (CPA) and terminal position assurance (TPA) when reconnecting connectors or replacing terminals.

Front probe

Disconnect the connector and probe the terminals from the mating side (front) of the connector.

CAUTION: Refer to [Test Probe Caution](#) .

NOTE: When probing female 0.64 terminals, it is important to use the correct adapter. There have been some revisions to the test adapter for 0.64 terminals. The proper adapter for 0.64 terminals is the J-35616-64B which has a gold terminal and a black wire between the base and tip. Failure to use the proper test adapter may result in damage to the terminal being tested and improper diagnosis.

NOTE: The proper adapter for probing the terminals for fuses, relays, or diodes in an electrical center is J-35616-35. Using any other tool or adapter may damage the terminal being tested.

Refer to the following table as a guide in selecting the correct test adapter for front probing connectors:

Test Adapter	Description
J-35616-2A	150 Male Probe Adapter (gray)
J-35616-3	150 Female Probe Adapter (gray)
J-35616-4A	280 Male Probe Adapter (purple)
J-35616-5	280 Female Probe Adapter (purple)
J-35616-6	100W Male (round) Probe Adapter (brown)
J-35616-7	100W Female (round) Probe Adapter (brown)
J-35616-8	Weather Pack Male Probe Adapter (orange)
J-35616-9	Weather Pack Female Probe Adapter (orange)
J-35616-10	100W Male (round) Probe Adapter (green)
J-35616-11	100W Female (round) Probe Adapter (green)
J-35616-12	130 Male Probe Adapter (blue)

Backprobe

NOTE:

- Backprobe connector terminals only when specifically required in diagnostic procedures.
- Do not backprobe a sealed (Weather Pack®) connector, less than a 280 series Metri-Pack connector, a Micro-Pack connector, or a flat wire connector.
- Backprobing can be a source of damage to connector terminals. Use care in order to avoid deforming the terminal, either by forcing the test probe too far into the cavity or by using too large of a test probe.
- After backprobing any connector, inspect for terminal damage. If terminal damage is suspected, test for proper terminal contact.

Do not disconnect the connector and probe the terminals from the harness side (back) of the connector.

TROUBLESHOOTING WITH A DIGITAL MULTIMETER

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: High voltage circuits should only be tested using a digital multimeter (DMM) and test leads with at least a CAT III rating, such as the J 39200-A Digital Multimeter. Failure to follow the procedures may result in serious injury or death.

CAUTION: Refer to [Test Probe Caution](#) .

Digital Multimeter (DMM) Basic Requirements

Service information is validated using digital multimeters that meet or exceed the following requirements. Using a multimeter that does not meet these basic requirements may give inaccurate readings which could lead to an incorrect diagnosis.

Display and Settings

1. Four digits displayed
2. Voltage, current, resistance, frequency, diode test settings, and min-max function
3. Display positive and negative values

Voltage

1. Have at least 10 M Ω input impedance
2. Test a DC voltage range of 0.1 - 1000 V.
3. Test an AC voltage range of 0.1 - 1000 V.

Current

1. Test a DC current range of 0.1 μ A - 10 A.
2. Test an AC current range of 0.1 μ A - 10 A.

Resistance

Test a resistance range of 0.1 Ω - 40 M Ω and displays infinite for a value greater than 40 M Ω (O.L. (Over-load))

Frequency

Test for a frequency range of 0.5 HZ - 199 K HZ

Diode Test

1. Apply at least 2 mA when performing the diode bias test
2. Display the break over voltage drop (0 - 3 V) of a forward biased diode
3. Display infinite (O.L. (Over-load)) when a diode is reverse biased

Min-Max Readings

1. Can update at a 25 ms sample rate
2. Saves and displays minimum and maximum values

NOTE: **Circuits which include any solid state control modules, such as the engine control module (ECM), should only be tested with a 10 megohm or higher impedance digital multimeter such as the EL-39200.**

The DMM instruction manual is a good source of information and should be read thoroughly upon receipt of the DMM as well as kept on hand for future reference.

A DMM should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The ohmmeter function on a DMM shows how much resistance exists between 2 points along a circuit. Low resistance in a circuit means good continuity.

NOTE: **Disconnect the power feed from the suspect circuit when measuring resistance with a DMM. This prevents incorrect readings. DMMs apply such a small voltage to measure resistance that the presence of voltages can upset a resistance reading.**

Diodes and solid state components in a circuit can cause a DMM to display a false reading. To find out if a component is affecting a measurement take a reading once, then reverse the leads and take a second reading. If

the readings differ the solid state component is affecting the measurement.

Following are examples of the various methods of connecting the DMM to the circuit to be tested:

- Probe both ends of the connector and either hold the leads in place while manipulating the connector or tape the leads to the harness for continuous monitoring while you perform other operations or test driving. Refer to [Probing Electrical Connectors](#).
- Disconnect the harness at both ends of the suspected circuit where it connects either to a component or to other harnesses.
- If the system that is being diagnosed has a specified pinout or breakout box, it may be used in order to simplify connecting the DMM to the circuit or for testing multiple circuits quickly.

TROUBLESHOOTING WITH A TEST LAMP

Special Tools

EL-35616-200 Test Light - Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

CAUTION: Refer to [Test Probe Caution](#) .

A test lamp can simply and quickly test a low impedance circuit for voltage. A digital multimeter (DMM) should be used instead of a test lamp in order to test for voltage in high impedance circuits. While a test lamp shows whether voltage is present if the impedance is low enough, a DMM indicates how much voltage is present. In other words, if there is not enough current, the test lamp will not illuminate even though voltage is present.

The **EL-35616-200** kit is Micro-Pack compatible and comprised of a 12 V light bulb with an attached pair of leads.

To properly operate this tool use the following procedures.

When testing for voltage:

1. Attach one lead to ground.
2. Touch the other lead to various points along the circuit where voltage should be present.
3. When the bulb illuminates, there is voltage at the point being tested.

When testing for ground:

1. Attach one lead to battery positive voltage.
2. Touch the other lead to various points along the circuit where ground should be present.
3. When the bulb illuminates, there is ground at the point being tested.

USING FUSED JUMPER WIRES

Special Tools

EL 35616-20F Fused Jumper Wire

For equivalent regional tools, refer to [Special Tools](#) .

NOTE: A fused jumper may not protect solid state components from being damaged.

Fig. 1: Fused Jumper Wire

Courtesy of GENERAL MOTORS COMPANY

The EL 35616-20F Fused Jumper Wire includes banana jack connectors that provide adaptation to most connectors without damage. This fused jumper wire is supplied with a 20 A fuse which may not be suitable for some circuits. Do not use a fuse with a higher rating than the fuse that protects the circuit being tested.

MEASURING VOLTAGE

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: Before working on any high voltage system, be sure to wear the following

Personal Protection Equipment:

- Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors
- Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors
 - Visually and functionally inspect the gloves before use.
 - Wear the Insulation gloves at all times when working with the high voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

CAUTION: Refer to [Test Probe Caution](#) .

The following procedure measures the voltage at a selected point in a circuit.

1. Disconnect the electrical harness connector for the circuit being tested, if necessary.
2. Enable the circuit and/or system being tested. Use the following methods:
 - Vehicle power mode to Vehicle in Service Mode or Vehicle On.
 - Turn ON the circuit and/or system with a scan tool in Output Controls.
 - Turn ON the switch for the circuit and/or system being tested.
3. Select the V (AC) or V (DC) position on the digital multimeter (DMM).
4. Connect the positive lead of the DMM to the point of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. The DMM displays the voltage measured at that point.

MEASURING VOLTAGE DROP

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

CAUTION: Refer to [Test Probe Caution](#) .

The following procedure determines the difference in voltage potential between 2 points.

Fig. 2: Measuring Voltage Drop

Courtesy of GENERAL MOTORS COMPANY

1. Set the Digital Multimeter (DMM) to the V (DC) position.
2. Connect the positive lead of the DMM to one point of the circuit to be tested.
3. Connect the negative lead of the DMM to the other point of the circuit.
4. Operate the circuit.
5. The DMM displays the difference in voltage between the 2 points.

MEASURING FREQUENCY

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

CAUTION: Refer to [Test Probe Caution](#) .

The following procedure determines the frequency of a signal.

NOTE: **Connecting the Digital Multimeter (DMM) to the circuit before pressing the Hz button will allow the DMM to autorange to an appropriate range.**

1. Apply power to the circuit.
2. Set the DMM to the V (AC) position.
3. Connect the positive lead of the DMM to the circuit to be tested.
4. Connect the negative lead of the DMM to a good ground.
5. Set to Hz on the DMM.
6. The DMM will display the frequency measured.

TESTING GROUND AND LOW REFERENCE CIRCUITS

Because a test lamp can light with up to 200 Ω in a ground or low reference circuit they are not recommended to be used for this type of test. A low impedance test lamp can light and indicate the circuit is good when there is as much as 20 - 30 Ω present, while a high impedance test lamp can light with up to 200 Ω present in the circuit. This is why the Digital Multi-Meter (DMM) is used when validating a ground or low reference circuit continuity.

When using the DMM there are many vehicle conditions that can affect the ground and low reference continuity testing. If these conditions are not met, a ground or low reference circuit test can fail on a good circuit. This may cause longer diagnosis time and incorrect component replacement.

Any current flow through a ground or low reference circuit, while being tested, will skew the DMM continuity reading, or display a reading higher than when there is no current flowing. Performing a ground or low reference circuit continuity test, in reference to the vehicles battery negative terminal, will have the highest risk of failing a good ground or low reference circuit test than any other ground reference point. The best ground test points would be a control module housing (if the control modules housing is metal and grounded), door jamb striker (if attached to metal), under dash metal frame work, engine block, or body ground studs (other than where the negative battery cable is attached).

A typical DMM ground or low reference circuit continuity reading can be as high as 100 Ω with the vehicle power mode in Vehicle ON or Vehicle in Service Mode, and drop to 15 - 25 Ω after switching the vehicle off. The reading will drop below 10 Ω after 30 - 40 s, then below 5 Ω after 60 s. Once the vehicle completely goes to sleep (generally 3-10 min) the reading will drop below 0.3 Ω .

The following list of conditions may need to be met to ensure a valid continuity reading on a ground or low reference circuit:

- Vehicle off
- Transmitter out of range of the vehicle
- Retained Accessory Power off (open and close the driver door after vehicle off)
- Battery charger set at a 2 A or less charge rate
- Scan tool not communicating with any vehicle control module (in some cases it may need to be disconnected from the DLC)
- All entry doors closed
- Headlamps off(auto headlamps disabled)
- Any delay lighting off

- HVAC after blow off
- Any accessory that can work when the vehicle power mode is Vehicle OFF
- Wait up to 60 s (after all other listed conditions are met)

Locking the doors with a remote transmitter can greatly reduce the time to achieve a valid ground or low reference continuity test result.

There are some low reference circuits that use a driver to isolate the circuit while the ignition is off. This is done in most cases for accidental reverse battery connections or reverse polarity jump starting. When this driver is present, the ignition will need to be on to validate the circuit.

TESTING FOR CONTINUITY

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#).

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

CAUTION: Refer to [Test Probe Caution](#).

The following procedures verify good continuity in a circuit.

With a Digital Multimeter (DMM)

1. Set the DMM to the Ω position.
2. Disconnect the power feed (i.e. fuse, control module) from the suspect circuit.
3. Disconnect the load.
4. Select the MIN MAX function on the DMM.
5. Connect one lead of the DMM to one end of the circuit to be tested.
6. Connect the other lead of the DMM to the other end of the circuit.
7. If the DMM displays low or no resistance, the circuit has good continuity.

With a Test Lamp

NOTE: Only use the test lamp procedure on low impedance power and ground circuits.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to one end of the circuit to be tested.
4. Connect the other lead of the test lamp to battery positive voltage.
5. Connect the other end of the circuit to ground.
6. If the test lamp illuminates (full intensity), then the circuit has good continuity.

TESTING FOR SHORT TO GROUND

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

CAUTION: Refer to [Test Probe Caution](#) .

The following procedures test for a short to ground in a circuit.

With a Digital Multimeter (DMM)

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Set the rotary dial of the DMM to the Ω position.
4. Connect one lead of the DMM to one end of the circuit to be tested.
5. Connect the other lead of the DMM to a good ground.
6. If the DMM does NOT display infinite resistance (OL), there is a short to ground in the circuit.

With a Test Lamp

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.
2. Disconnect the load.
3. Connect one lead of the test lamp to battery positive voltage.
4. Connect the other lead of the test lamp to one end of the circuit to be tested.
5. If the test lamp illuminates, there is a short to ground in the circuit.

Fuse Powering Several Loads

1. Review the system schematic and locate the fuse that is open.
2. Open the first connector or switch leading from the fuse to each load.
3. Connect a DMM across the fuse terminals (be sure that the fuse is powered).
 - When the DMM displays voltage the short is in the wiring leading to the first connector or switch.
 - If the DMM does not display voltage refer to the next step.
4. Close each connector or switch until the DMM displays voltage in order to find which circuit is shorted.

TESTING FOR A SHORT TO VOLTAGE

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

CAUTION: Refer to [Test Probe Caution](#) .

The following procedure tests for a short to voltage in a circuit.

1. Remove the power feed (i.e. fuse, control module) from the suspect circuit.

2. Disconnect the load.
3. Set the digital multimeter (DMM) to the V (DC) position.
4. Connect the positive lead of the DMM to one end of the circuit to be tested.
5. Connect the negative lead of the DMM to a good ground.
6. Switch the vehicle power mode to Vehicle in Service Mode and operate all accessories.
7. If the voltage measured is greater than 1 V, there is a short to voltage in the circuit.

TESTING FOR INTERMITTENT CONDITIONS AND POOR CONNECTIONS

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#).

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the

connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers (BEC)

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center (BEC). Use **EL-35616** kit to test for proper terminal contact. Failure to use **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the

connector as oil from your skin may be a source of contamination as well.

3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter from the on the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#), and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#), and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference (EMI) or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition components, motors, generator, etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.
- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#).
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

INDUCING INTERMITTENT FAULT CONDITIONS

Special Tools

EL-25070 Heat Gun

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: **Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:**

- **Safety glasses with appropriate side shields when within 50 feet of the vehicle, either indoors or outdoors**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors**
 - **Visually and functionally inspect the gloves before use.**
 - **Wear the Insulation gloves at all times when working with the high**

voltage battery assembly, whether the system is energized or not.

Failure to follow the procedure exactly as written may result in serious injury or death.

Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, torque, bumps/rough pavement, etc. In order to duplicate the customer's concern, it may be necessary to manipulate the wiring harness if the malfunction appears to be vibration related. Manipulation of a circuit can consist of a wide variety of actions, including:

- Wiggling the harness
- Disconnecting a connector and reconnecting
- Stressing the mechanical connection of a connector
- Pulling on the harness or wire in order to identify a separation/break inside the insulation
- Relocating a harness or wires

All these actions should be performed with some goal in mind. For instance, with a scan tool connected, wiggling the wires may uncover a faulty input to the control module. The snapshot option would be appropriate here. Refer to [Scan Tool Snapshot Procedure](#). Another option is, with the component commanded ON and OFF by the scan tool, to move related connectors and wiring and observe the component operation. With the vehicle ON, move related connectors and wiring while monitoring vehicle operation. If harness or connector movement affects the data displayed, component/system operation, or vehicle operation, inspect and repair the harness/connections as necessary.

You may need to load the vehicle in order to duplicate the concern. This may require the use of weights, floor jacks, jackstands, frame machines, etc. In these cases you are attempting to duplicate the concern by manipulating the suspension or frame. This method is useful in finding harnesses that are too short and their connectors pull apart enough to cause a poor connection. A DMM set to the Min/Max mode and connected to the suspect circuit while testing can yield desirable results. Refer to [Testing for Electrical Intermittents](#).

Certainly, using the senses of sight, smell, and hearing while manipulating the circuit can provide good results as well.

There may be instances where circuit manipulation alone will not meet the required criteria for the fault condition to appear. In such cases it may be necessary to expose the suspect circuit to other conditions while manipulating the harness. Such conditions would include high moisture conditions, along with exceptionally high or low temperatures. The following discusses how to expose the circuit to these kinds of conditions.

High Temperature Conditions

If the complaint tends to be heat related, you can simulate the condition using the **EL-25070** heat gun.

Using the heat gun, you can heat up the suspected area or component. Manipulate the harnesses under high temperature conditions while monitoring the scan tool or DMM to locate the fault condition.

The high temperature condition may be achieved simply by test driving the vehicle at normal operating temperature. If a heat gun is unavailable, consider this option to enhance your diagnosis. This option does not allow for the same control, however.

Low Temperature Conditions

Depending on the nature of the fault condition, placing a fan in front of the vehicle while the vehicle is in the

shade can have the desired effect.

If this is unsuccessful, use local cooling treatments such as ice or a venturi type nozzle (one that provides hot or cold air). This type of tool is capable of producing air stream temperatures down to -18°C (0°F) from one end and $+71^{\circ}\text{C}$ (160°F) from the other. This is ideally suited for localized cooling needs. In addition, circuit cooling spray can be used to cool down a component or circuit.

Once the vehicle, component, or harness has been sufficiently cooled, manipulate the harness or components in an effort to duplicate the concern.

Duplicating Failure Conditions

- If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions.
- Freeze Frame/Failure Records data, where applicable, contains the conditions that were present when the DTC set.
 1. Review and record Freeze Frame/Failure Records data.
 2. Clear the DTCs using the scan tool.
 3. Switch the vehicle power mode to Vehicle Off and wait 15 seconds.
 4. Operate the vehicle under the same conditions that were noted in Freeze Frame/Failure Records data, as closely as possible. The vehicle must also be operating within the Conditions for Running the DTC. Refer to Conditions for Running the DTC in the supporting text if a DTC is being diagnosed.
 5. Monitor DTC Status for the DTC being tested. The scan tool will indicate Ran, when the enabling conditions have been satisfied long enough for the DTC to run. The scan tool will also indicate whether the DTC passed or failed.
- An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the concern occurs, may help you locate the concern.

TESTING FOR ELECTRICAL INTERMITTENTS

Special Tools

EL-39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#).

WARNING: This procedure should not be performed on high voltage circuits. Performing this procedure on high voltage circuits may result in serious injury or death.

Perform the following procedures while wiggling the harness from side to side. Continue this at convenient points (about 6 inches apart) while watching the test equipment.

- [Testing for Short to Ground](#)
- [Testing for Continuity](#)
- [Testing for a Short to Voltage](#)

If the fault is not identified, perform the procedure below using the MIN MAX feature on the **EL-39200** DMM. This feature allows you to manipulate the circuit without having to watch the DMM. The DMM will generate an audible tone when a change is detected.

NOTE: The DMM must be used in order to perform the following procedure since the DMM can monitor current, resistance or voltage while recording the minimum (MIN), and maximum (MAX) values measured.

1. Connect the DMM to both sides of a suspected connector (still connected), or from one end of a suspected circuit to the other. Refer to [Troubleshooting with a Digital Multimeter](#) for information on connecting the DMM to the circuit.
2. Set the rotary dial of the DMM to the V (AC) or V (DC) position.
3. Press the range button of the DMM in order to select the desired voltage range.

NOTE: The 100 ms RECORD mode is the length of time an input must stay at a new value in order to record the full change.

4. Select the MIN MAX function of the DMM. The DMM displays the 100 ms RECORD and emits an audible tone (beep).
5. Simulate the condition that is potentially causing the intermittent connection, either by wiggling the connections or the wiring, test driving, or performing other operations. Refer to [Inducing Intermittent Fault Conditions](#).
6. Listen for the audible Min Max Alert which indicates that a new minimum or maximum value has been recorded.
7. Press the MIN MAX button until the MAX value is displayed and note the value.
8. Press the MIN MAX button until the MIN value is displayed and note the value.
9. Determine the difference between the MIN and MAX values.
 - If the variation between the recorded MIN and MAX voltage values is 1 V or greater an intermittent open or high resistance condition exists. Repair the condition as necessary.
 - If the variation between the recorded MIN and MAX voltage values is less than 1 V an intermittent open or high resistance condition does not exist.

SCAN TOOL SNAPSHOT PROCEDURE

Reviewing Stored Data in Global Diagnostic System (GDS)

Overview

A snapshot is a recording of what a control module on the vehicle was receiving for information while the snapshot is being made. A snapshot is used to analyze the data during the time a vehicle condition is current. In GDS 2 there is not a traditional snapshot as there has been in the past. GDS 2 saves all past VIN and diagnostic data for future viewing. GDS 2 automatically records data whenever the user views Module Diagnostics, Vehicle Diagnostics and/or Systems Diagnostics. Module Diagnostics includes DTC Data, Identification Information, Data Display, Control Functions and Configuration/Reset Functions. Vehicle Diagnostics includes Vehicle Wide DTCs. Systems Diagnostics includes Inspection/Maintenance Status and Inspection/Maintenance Information.

Reviewing Stored Data

The Review Stored Data function allows viewing and playing of previously recorded vehicle data. This information can be used in analysis of vehicle problems and detection of trigger error conditions. The graph function can be used to compare multiple parameters to see if a component is functioning properly. Recorded sessions can be selected for viewing by the following two methods:

- From the Home Page, click on Review Stored Data. In the Review Stored Data page, highlight a vehicle in the Sessions screen located in the upper pane and highlight the desired Stored Data in the lower pane, then click the Review button.
- The user can view stored data without ending a current on-vehicle diagnostic session by clicking the Vehicle Menu button (when active) or Back button until the Session Manager is displayed in the menu. This is used when a user is viewing live data and wants the quickest way to review the data. Click on the Session Manager button. Highlight the desired Stored Data in the lower pane and click the Review button.

Stored Data Review Selections

The following information can be selected in the tabs at the top of the screen:

- Graphical Data Display - Allows a detailed review of parameter data. The buttons on the right side modify the graph data
- Diagnostic Data Display - Displays incoming information from the file. The current value of the parameters is displayed on the screen.
- Line Graph - Allows selected locked parameters to be graphed with parameters overlaid for data comparison. The current value of the parameters is displayed on the screen. Use the buttons on the right side to modify the graph data.
- Bookmarks - If bookmarks are present, this displays the Type, Description and Time of automatic and manually generated bookmarks.
- System Information - Displays the GDS 2 Software Version and MDI Serial Number used when the session was recorded.
- Selected Vehicle Configuration - Displays vehicle identifiers, such as transmission type, for the vehicle selected on the Stored Data Review screen in the Sessions field.
- RPO - Displays vehicle build information.

Graphical Data Display

On the Graphical Data Display tab there are multiple selections at the top of the page. The selections available are:

- Create Report - Opens an internet browser page where a data display report can be printed or saved for future reference.
- Unit Switch - Toggles graph units between English and metric.
- Lock - When a parameter is selected, clicking the lock button locks a selected parameter for viewing in the Line Graph tab. In the Line Graph tab, locked parameters are isolated and overlaid for data comparison.
- Up Arrow - Click the up arrow to move a highlighted parameter up a position on the list.
- Down Arrow - Click the down arrow to move a highlighted parameter down a position on the list.
- Save As - This selection is available in the Graphical Data Display and Diagnostic Data Display tabs. This allows the user to export the graph data to a worksheet for in depth analysis and to timestamp data.

Review Stored Data Functions

To review the session there are buttons at the bottom of the window to control the cursor. From left to right the buttons are:

- Insert Bookmark - This button allows the user to insert bookmarks anywhere along the timeline. This

provision allows the user to record notes regarding the inserted bookmark.

- Return Bookmark - This button moves the cursor to the previous bookmark.
- Back - This button moves the cursor back 1 frame.
- Timeline Slider Control - This allows the user to slide and select any position on the Timeline required.
- Forward - This button moves the cursor forward 1 frame.
- Forward Bookmark - This button moves the cursor forward 1 bookmark.
- Bookmarks - Allows the user to toggle bookmark visibility ON and OFF.

Graphical Preference Selections

The vertical side bar on the right side of the screen in the Graphical Data Display and Line Graph tabs toggles the Graphical Selection Panel from hidden to visible. The graphical preference selections available are:

- Reset - Resets the graph display back to the initial standard GDS 2 setting.
- Grid Line Toggle - This toggle reverses the current state of showing or removing grid lines.
- Hash Mark Toggle - This toggle reverses the current state of showing or removing data acquisition points or hash marks.
- Horizontal Graph Compression - Compresses the scale of the graph horizontally.
- Horizontal Graph Expansion - Expands the scale of the graph horizontally.
- Vertical Graph Compression - Compresses the scale of the graph vertically.
- Vertical Graph Expansion - Expands the scale of the graph vertically.
- Move Centerline of Graph Up - Moves the centerline of the graph up incrementally.
- Move Centerline of Graph Down - Moves the centerline of the graph down incrementally.

CIRCUIT PROTECTION - FUSES

Special Tools

EL - 39200 Digital Multimeter (DMM)

For equivalent regional tools, refer to [Special Tools](#) .

Fig. 3: Identifying Open Fuse Element
 Courtesy of GENERAL MOTORS COMPANY

The fuse is the most common method of an automotive wiring circuit protection. Whenever there is an excessive amount of current flowing through a circuit the fusible element will melt and create an open or incomplete circuit. Fuses are a one time protection device and must be replaced each time the circuit is overloaded. To determine if a fuse is open, remove the suspected fuse and examine if the element in the fuse is broken (2). If not broken (1), also check for continuity using a Digital Multimeter (DMM) or a continuity tester. If the element is broken or continuity is suspect, replace the fuse with one of equal current rating.

Fuse Types

Current Rating Amperes	Color
Auto Fuses, Mini Fuses	
2	Gray
3	Violet
5	Tan
7.5	Brown

Current Rating Amperes	Color

Midi Fuses	
80	Black
Mega Fuses	
100	Black
150	Black
200	Black

CIRCUIT PROTECTION - CIRCUIT BREAKERS

A circuit breaker is a protective device that is designed to open the circuit when a current load is in excess of the rated breaker capacity. If there is a short or other type of overload condition in the circuit, the excessive current will open the circuit between the circuit breaker terminals. Two types of circuit breakers are used.

Circuit Breaker

This type opens when excessive current passes through it for a period of time. It closes again after a few seconds, and if the cause of the high current is still present, it will open again. The circuit breaker will continue to cycle open and closed until the condition causing the high current is removed.

Positive Temperature Coefficient (PTC) Circuit Breaker

This type greatly increases its resistance when excessive current passes through it. The excessive current heats the PTC device, as the device heats its resistance increases. Eventually the resistance gets so high that the circuit is effectively open. Unlike the ordinary circuit breaker the PTC unit will not reset until the circuit is opened, by removing the voltage from its terminals. Once the voltage is removed the circuit breaker will re-close within a second or 2.

CIRCUIT PROTECTION - FUSIBLE LINKS

Special Tools

For equivalent regional tools, refer to [Special Tools](#) .

NOTE: When repairing a fusible link, fusible links cut longer than 225 mm (approximately 9 in) will not provide sufficient overload protection.

Fusible link is wire designed to melt and break continuity when excessive current is applied. It is often located between or near the battery and starter or electrical center. Use a continuity tester or a Digital Multimeter (DMM) at each end of the wire containing the fusible link in order to determine if it is broken. If broken, it must be replaced with fusible link of the same gauge size.

WIRING REPAIRS

The Wiring Repairs section contains the following types of wiring repair information. Using these elements together will make wiring repair faster and easier:

- [Flat Wire Repairs](#)
- [Serial Data Circuit Wiring Repairs](#)
- [High Temperature Wiring Repairs](#)
- [Heated Oxygen Sensor Wiring Repairs](#)
- [Wire to Wire Repair](#)
- [Splicing Inline Harness Diodes](#)
- [Splicing Twisted or Shielded Cable](#)
- [SIR/SRS Wiring Repairs](#)

CONNECTOR REPAIRS

Connector Repairs contains a list of all connector repairs. The connector repairs are listed by the connector manufacturer and then by connector type. If the technician cannot identify the manufacturer of the connector, refer to Identifying Connectors below. Knowing the connector manufacturer will assist in finding the correct connector repair from the following list:

- [Connector Position Assurance Locks](#)
- [Terminal Position Assurance Locks](#)
- [AFL/EPC Connectors](#)
- [Bosch Connectors \(BSK\)](#) [Bosch Connectors \(0.64\)](#) [Bosch Connectors \(2.8 JPT\)](#) [Bosch Connectors \(ECM\)](#)
- [Delphi Connectors \(Weather Pack\)](#) [Delphi Connectors \(Push To Seat\)](#) [Delphi Connectors \(Pull To Seat\)](#) [Delphi Connectors \(Micro-Pack 100W\)](#) [Delphi Connectors \(Micro.64\)](#) [Delphi Connectors \(12-Way\)](#) [Delphi Connectors \(Steering Gear\)](#)
- [FCI Connectors \(Lever Lock\)](#) [FCI Connectors \(SIR\)](#)
- [FEP Connectors \(Steering Gear\)](#)
- [JST Connectors](#)
- [Kostal Connectors \(Glow Plug Control Module\)](#) [Kostal Connectors \(Transmission\)](#)
- [Molex Connectors \(Lever Lock\)](#) [Molex Connectors \(SIR\)](#)
- [Sumitomo Connectors](#)

- [Tyco/AMP Connectors \(CM 42-Way\)](#) [Tyco/AMP Connectors \(Sensor\)](#) [Tyco/AMP Connectors \(0.25 Cap\)](#) [Tyco/AMP Connectors \(43-Way\)](#) [Tyco/AMP Connectors \(Door Module\)](#) [Tyco/AMP Connectors \(Seat\)](#) [Tyco/AMP Connectors \(102-Way Inline\)](#) [Tyco/AMP Connectors \(SIR\)](#)
- [Yazaki Connectors \(2-Way\)](#) [Yazaki Connectors \(16-Way\)](#)
- [Repairing Connector Terminals \(Terminated Lead Repair\)](#) [Repairing Connector Terminals \(Terminal Repair\)](#)

Connector Anatomy

7	Terminal Positive Assurance (TPA)

Callout	Component Name
8	Terminal Positive Assurance (TPA)
9	Connector Seal
10	Connector Housing
11	Inner Connector

Identifying Connectors

Knowing the connector manufacturer is helpful when trying to locating the correct connector repair procedure. There are many different connector designs used on GM vehicles and it is sometimes difficult to identify the connector manufacturer. The information in this document should help with the identification of connector manufactures.

The following connector manufacturers make most of the connectors found in GM vehicles:

- AFL/EPC (Alcoa Fujikura Ltd./Engineered Plastics Components)
- Bosch
- Delphi
- FCI (Framatome Connectors International)
- JAE (Japan Aviation Electronics)
- JST (Japan Solderless Terminals)
- Kostal
- Molex
- Sumitomo
- Tyco/AMP
- Yazaki

Identifying the manufacturer of a connector is often difficult. When trying to determine the manufacturer of a connector, look for specific identifying marks that are unique to that connector supplier. Most of these identify marks are hard to find or see. Check the connector carefully and refer to the information below for pictures and descriptions of connector identification markings.

Fig. 5: View Of EPC Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- Most of AFL's connectors have EPC on their connector body. Some of the smaller connectors will not have any markings on them.

Fig. 6: View Of Bosch Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- In some cases Bosch will actually be printed on the connector. If Bosch does not appear on the connector, look for the Bosch logo. The Bosch logo is a circle with a blunted arrow inside. This logo can appear anywhere on the connector and is often very small.

Fig. 7: View Of PED Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- In some cases Delphi will actually be printed on the connector. If Delphi is not printed on the connector, look for PED. In both cases there is no specific orientation for Delphi or PED and they can appear anywhere on the connector.

Fig. 8: View Of FCI Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- FCI connectors may have the FCI logo on their connectors. The logo is the letters FCI with an "A" above it.

Fig. 9: View Of JAF Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- JAE connector have JAE in small letters on their connectors.

Fig. 10: View Of JST Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- JST connectors have JST in small letters on their connectors, similar to that above. The location of the logo will vary with the connector size and style.

Fig. 11: View Of Kostel Connector Identifier

Courtesy of GENERAL MOTORS COMPANY

- Kostel has an "LK" with a circle around it. These connector are usually used as a transmissions connection.

Fig. 12: View Of Molex Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

Fig. 13: View Of Sumitomo Identification On Connector Body

Courtesy of GENERAL MOTORS COMPANY

- Most Molex connectors will have the Molex logo on the dresscover of the connector. In some cases the connectors may have MX followed by another letter. The third letter indicates where the connector was made. A connector with MXD is a Molex connector made in Detroit.

Sumitomo has a unique symbol on their connector and possibly a part number. The symbol is similar to that of a diamond lying on its side, similar to that shown. The logo could appear anywhere but the most common place is at the wire side of the housing.

- Tyco/AMP has many different and unique connector designs. Some may or may not have identifiable marks on them.

Fig. 14: View Of Yazaki Identification On Connector Body
Courtesy of GENERAL MOTORS COMPANY

- Yazaki has a wedge or arrow shape, similar to that shown.

ACCESSORIES & EQUIPMENT

Wiring Systems and Power Management - Repair Instructions - Volt

REPAIR INSTRUCTIONS

REPAIRING DAMAGED WIRE INSULATION

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

If the wire insulation has been chafed, or broken, enough to show the conductive portion of the wire, and the wire is not damaged, determine the length of insulation that needs to be repaired. If the repair is less than 280 mm (11 in), cut the wire within the damaged area. Then slide the appropriate heat shrink tubing (listed below) over the wire, and repair the wire by splicing the wires together. Refer to [Wire to Wire Repair](#). Once the wire is spliced together slide heat shrink tubing over the damaged area and apply heat to seal the repaired wire.

If the wire is damaged, or the damaged area is larger than 280 mm (11 in), then replace the damaged wire by splicing in a new section of wire. Refer to [Wire to Wire Repair](#).

GM Part Number	Diameter		Description	Color	Length	
	Metric	English			Metric	English
12355003	9.5 mm ²	0.375 in	Tubing, Shrink 3/8	Black	305 mm ²	12 in
12355005	12.7 mm ²	0.5 in	Tubing, Shrink 1/2	Black	305 mm ²	12 in
12355011	19.1 mm ²	0.75 in	Tubing, Shrink 3/4	Black	305 mm ²	12 in
12355008	25.4 mm ²	1.0 in	Tubing, Shrink 1.00	Black	305 mm ²	12 in

Wire Size Conversion

Metric Wire Sizes (mm ²)	AWG Sizes
0.13	26
0.20	24
0.32	22
0.52	20
0.82	18
1.31	16
2.09	14
3.30	12
5.27	10

Metric Wire Sizes (mm ²)	AWG Sizes
8.35	8
13.3	6

COAXIAL CABLE REPAIRS

The GM global coaxial cable repair strategy uses coaxial cables, connectors and jumpers to repair coaxial cables. The intent is to install the new service cable in vehicle, but removal of the old cable is not necessary. There are several repair scenarios:

- New cables, jumpers, and connector housing are required.
- Only new cables are required while it is possible to reuse the existing connector housing in vehicle. A jumper may or may not be needed.
- Only new connector housing are required, while it is possible to reuse the existing cable in the vehicle.
- A new cable would need to be installed from source to destination and by-pass the inline connector in some cases when an inline connector is unrepairable (Example: a cracked male end of a 1-way connector).

Coaxial Cable Kits

Four different kits will be available to repair coaxial cables. Components of each kit cannot be ordered separately from the kit.

- **Communication Interface Module Antenna Cable Kit** (Kit # 13581174) is used to repair Cellular coaxial cables. This kit uses RG58 low loss coaxial cables that are available in four lengths. The coaxial cables can be attached together in various lengths to closely match the length of the faulty/damaged coaxial cable.
- **Digital Radio and Vehicle Locator Antenna Coaxial Cable Kit** (Kit # 13581173) is used to repair XM and GPS coaxial cables. For vehicles that have a combined GPS and Cellular/OnStar signal on one cable, use Kit # 13581174. This kit uses RG316 low loss coaxial cables that are available in three lengths. The coaxial cables can be attached together in various lengths to closely match the length of the faulty/damaged coaxial cable.
- **Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit** (Kit # 19119056) is used with OnStar, XM, and GPS cables. This kit consists of jumpers and connectors. The jumpers are used to adapt different types of connectors together (to attach 2-way and 3-way connector onto the long 7, 5, and 3 foot cables). The connectors are used to replace existing connectors. The 1-way and 2-way connectors in the kit are in water-blue color (different than what the vehicle is built with) and are non-keyed (universal fit). The 3-way connectors in the kit are in the same color as in the vehicle.
- **Communication Interface Module Antenna Cable Kit** (Kit # 22803854) is used for the OnStar module on some vehicles built before the 2011 model year.

Coaxial Cable Repair Kits

Repair Kit Name	Description
Communication Interface Module Antenna Cable Kit (Kit # 13581174)	RG58 coaxial cable with female/female connectors - 7ft/2.1m
	RG58 coaxial cable with female/male connectors - 5ft/1.5m
	RG58 coaxial cable with female/male connectors - 3.5ft/1.1m

Repair Kit Name		Description
		RG58 coaxial cable with female/male connectors - 3.5ft/1.1m
Digital Radio and Vehicle Locator Antenna Coaxial Cable Kit (Kit # 13581173)		RG316 coaxial cable with female/female connectors - 7ft/2.1m
		RG316 coaxial cable with female/male connectors - 5ft/1.5m
		RG316 coaxial cable with female/male connectors - 3.5ft/1.1m
Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit (Kit # 19119056)	3-way Gen 1 sub-kit	1-way to 3-way Gen 1 jumper for female connector - Part # 13581154 - 4in/10cm
		1-way to 3-way Gen 1 jumper for male connector - Part # 19119052 - 4in/10cm
		White female connector
		White male connector
		Blue female connector
		Blue male connector
	3-way Gen 2 sub-kit	1-way to 3-way Gen 2 jumper for female connector - Part # 13581155 - 4in/10cm
		1-way to 3-way Gen 2 jumper for male connector - Part # 19119058 - 4in/10cm
		Tan female connector
		Tan male connector
		Gray female connector
		Gray male connector
	2-way Gen 1 sub-kit	1-way to 2-way Gen 1 jumper for female connector - Part # 13581156 - 4in/10cm
		Water-blue female connector
	2-way Gen 2 sub-kit (wide)	1-way to 2-way Gen 2 jumper for female connector - Part # 13581157 - 4in/10cm
		1-way to 2-way Gen 2 jumper for male connector - Part # 13581158 - 4in/10cm
		Water-blue female connector
		Water-blue male connector
	2-way Gen 2 and 3 sub-kit (narrow)	1-way to 2-way Gen 2 and 3 jumper for female connector - Part # 13582468 - 4in/10cm
		Use the 1-way to 2-way Gen 2 jumper for female connector 19119058 - 4in/10cm from the 2-way Gen 2 sub-kit.

Repair Kit Name	Description
	Water-blue female connector
	Water-blue male connector
	Right-angle jumper with water-blue universal 1-way connector - 4in/10cm
Communication Interface Module Antenna Cable Kit (Kit # 22803854)	1-way to mini UHF jumper - 4in/10cm

Connector Housing Repair Procedure

The connector housings (available in Digital Radio, Mobile Telephone and Vehicle Locator Antenna Coaxial Cable Kit) are available for 1-way housings, 2-way housings and 3-way housings. Determine the connector housing required:

1-way housing

No change to the service coaxial cable is necessary in order to install the new coaxial cable into the vehicle.

2-way housing

A 4-inch jumper is required.

1. Determine the appropriate generation (1, 2, or 3) and/or size (12.7mm or 8mm) of the 2-way housing that is in the vehicle.
2. Remove the faulty/damaged coaxial cable from the 2-way connector housing by removing the terminal position assurance (TPA) from the connector housing and then slide the cable out of the connector.

Fig. 1: Connector Housing

Courtesy of GENERAL MOTORS COMPANY

3. Install the new service coaxial cable into the vehicle. Use the 4-inch jumper for the appropriate 2-way connector housing to connect the new service coaxial cable to the connector housing.
4. If the issue is found to be the connector housing and not cable, a new connector housing may be installed while reusing all other components.

3-way housing

A 4-inch jumper is required.

1. Determine the appropriate generation (1 or 2) and keyed 3-way connector housing based on the connector housing color.
2. Note the locations of each of the cables in 3-way housing, as it is important for new cables be placed in the appropriate terminal location in the new connector. The connector housing colors are not interchangeable.
3. Remove the faulty/damaged coaxial cable from the 3-way connector housing by using a pair of side/diagonal cutters to nip and break away the housing.

Fig. 2: Using Side/Diagonal Cutters To Nip And Break Away Connector Housing
Courtesy of GENERAL MOTORS COMPANY

4. Use caution not to damage the conductive ends of the coaxial cables inside the connector housing. Do not bend or force the terminal out or it could be damaged.

Fig. 3: Connecting New Service Coaxial Cable To New 3-Way Connector Housing
Courtesy of GENERAL MOTORS COMPANY

5. Install the new service coaxial cable into the vehicle. Use the 4-inch jumper for the appropriate color 3-way connector housing to connect the new service coaxial cable to the new 3-way connector housing.
6. If the issue is found to be the connector housing and not cable, a new connector housing may be installed while reusing all other components.

Coaxial Cable Repair Procedure

1. Identify the faulty/damaged coaxial cable.
2. Disconnect the faulty/damaged coaxial cable and leave it in the vehicle.
3. Identify the type of coaxial cable to be replaced and match up with the appropriate pieces to repair the damaged coaxial cable. Match up the type of coaxial cable, cable length and connector types. In some cases there may be extra length of cable left over.

Fig. 4: Coaxial Cable

Courtesy of GENERAL MOTORS COMPANY

NOTE: Avoid routing the new coaxial cable near sharp edges that can damage the new coaxial cable.

4. Install the new coaxial cable in the vehicle.

Use tie-straps to attach the new service coaxial cable to existing harnesses or brackets. Use felt tape/foam to reduce rattles, as necessary.

NOTE: To avoid permanent damage, do not pinch the cable or bend it tighter than a 2 inch (5 centimeter) radius.

5. Remove the faulty/damaged connectors, if applicable.
6. Install new connectors or jumpers, as needed. Refer to Connector Housing Repair Procedure.
7. Verify the repair by operating the system with the vehicle in Service Mode.

FLAT WIRE REPAIRS

The flat wire within the flex wiring harness is not serviceable. If an open or short exists within the flex wiring

harness the complete harness must be replaced.

FOLDED-OVER WIRE REPAIR

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to [Special Tools](#) .

The GM global wire repair strategy uses connector assemblies (pigtails) and terminated leads to repair wiring harnesses.

To reduce and manage GM Service Parts proliferation, the service pigtails and terminated leads are designed with the largest wire gauge size that can be held by either the terminal or the connector housing.

The folded over wire repair technique, in which the copper wire strands are folded over before being installed into a splice sleeve, allows the service part to be used when repairing a smaller gauge size wire in a vehicle. This technique has passed all GM testing standards.

Fig. 5: View Of Stripped Wires In Splice Sleeve Connector

Courtesy of GENERAL MOTORS COMPANY

The larger harness size wires (1) will be placed in one side of the splice sleeve and match the splice sleeve closely in size. The wires are moved into the splice sleeve until they hit the stop (4) in the splice sleeve. The smaller harness size wires (2) will be placed in the other side of the splice sleeve. The smaller harness size wires will be folded over (3) to match up with the splice sleeve size.

Use the folded over wire repair for:

NOTE: Increasing the amount of copper strands in the smaller gauge size will allow for a better crimp

- Splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes)

NOTE: Vehicle side needs to be of same or less gauge size (not greater than the service part's gauge size)

- Splicing wires of different gauges

Use the Service Information (SI) connector end-views to determine:

- Gauge size of wiring harness
- Recommended Repair: Terminated Lead or Pigtail

The following table lists the acceptable variance within the gauge size

Folded-Over Wire Selection Table

Harness Wire Gauge		Connector Assembly (Pigtail) or Terminated Lead Wire Gauge Size			
-		Salmon Color Splice Sleeve		Blue Color Splice Sleeve	Yellow Color Splice Sleeve
Metric	-	0.35 mm	0.5 - 0.8 mm	1.0 - 2.0 mm	3.0 - 6.0 mm
-	Wire Gauge (AWG)	22	20 - 18	16 - 14	12 - 10
0.13 mm	26	Fold Over Wire	Double Fold Over Wire	Not Acceptable	Not Acceptable
0.22 mm	24	Fold Over Wire	Fold Over Wire	Not Acceptable	Not Acceptable
0.35 mm	22	Wire to Wire	Fold Over Wire	Double Fold Over Wire	Not Acceptable
0.5 mm	20	Not Acceptable	Wire to Wire	Fold Over Wire	Not Acceptable
0.75 mm	-	Not Acceptable	Wire to Wire	Fold Over Wire	Double Fold Over Wire
0.8 mm	18	Not Acceptable	Wire to Wire	Fold Over Wire	Double Fold Over Wire
1.0 mm	16	Not Acceptable	Not Acceptable	Wire to Wire	Double Fold Over Wire
1.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.0 mm	14	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire
2.5 mm	-	Not Acceptable	Not Acceptable	Wire to Wire	Fold Over Wire

Harness Wire Gauge		Connector Assembly (Pigtail) or Terminated Lead Wire Gauge Size			
3.0-6.0 mm	12 - 10	Not Acceptable	Not Acceptable	Not Acceptable	Wire to Wire

Example

For an IP Harness of 0.22 mm (24 gauge on left side of table) wire size, the SI connector end-view recommends a pigtail with leads of 0.8 mm (18 gauge on the top of the table) with a salmon colored DuraSeal splice sleeve of 0.5 - 1.0 mm (20 - 16 gauge).

Follow these steps to use the folded over wire (1) technique on an IP Harness.

Fig. 6: View Of Stripped Wires
Courtesy of GENERAL MOTORS COMPANY

Strip twice the amount of insulation on the smaller (1) wire (IP Harness is the lower wire) than normally required. Normally, the terminated leads have 5 mm of insulation stripped off the wire.

Fig. 7: Splice Sleeve Crimping Tool

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use EL-38125-10 splice sleeve crimping tool (non GMNA) or J-38125-8 splice sleeve crimping tool (GMNA).

1. For wiring repair, refer to [Wire to Wire Repair](#).

Fig. 8: View Of Twisted And Folded Wire To Length

Courtesy of GENERAL MOTORS COMPANY

2. Twist the wires before you fold them over to prevent the wire strands from opening up. Fold over the copper wire strands of the smaller (1) gauge wire so that it is the same length as the non-folded wire.

Fig. 9: View Of Folded Wire & Splice Sleeve
Courtesy of GENERAL MOTORS COMPANY

3. Insert the folded over wire (1) into the splice sleeve.

Fig. 10: Crimping The Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

4. Use the proper crimp tool to crimp the splice sleeve to the smaller wire (harness side of repair). Complete the crimp as usual (using the heat tool to shrink the tube).

SERIAL DATA CIRCUIT WIRING REPAIRS

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- DuraSeal splice sleeves
- A wire stripping tool

For equivalent regional tools, refer to [Special Tools](#).

The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides necessary contact integrity for the sensitive, low energy

circuits.

The GM Local Area Network (GMLAN) System requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working on GMLAN connectors and terminals.

GMLAN Repairs

NOTE: When making a repair to any GMLAN network, the original wire length after the repair must be the same length as before the repair. If the network is a twisted pair, the twist must be maintained after the repair is completed.

GMLAN has 2 types of networks, low speed and high speed. Low speed GMLAN has a single wire and works at slow speeds. High speed GMLAN has 2 wires in a twisted pair and works at higher speeds. For more information on GMLAN, refer to [Data Link Communications Description and Operation](#).

GMLAN Connector Terminal Repair

NOTE: A terminated lead can be used to replace damaged connector terminals for both high speed and low speed GMLAN systems. When making a connector terminal repair on a GMLAN high speed system with twisted pair wires, do not untwist the wires more than necessary to make the repair.

If the individual terminals are damaged on any GMLAN connection, use the appropriate connector repair procedure in order to repair the terminal. Refer to [Connector Repairs](#) for the appropriate connector repair procedure.

GMLAN Wire Repair

NOTE: Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm², 0.8 mm², 1.0 mm² etc.). Use the DuraSeal splice sleeves and **EL-38125-10** tool. For wiring repair, refer to [Wire to Wire Repair](#).

Media Oriented Systems Transport (MOST) Wiring Repair

NOTE: If harness repair/analysis is performed, MOST bus Twist Pair unshielded wire should be 0.35 mm² (22 AWG) wire with at least one twist per each 1 45/64 inch (45 mm) and must not be untwisted for more than 3 15/16 of an inch (10 cm).

The following conditions need to be met to ensure a valid continuity:

- Untwisted length for all MOST 50 circuits at each wire harness connector should be no longer 50 mm max (25 mm preferred).
- When wire repairs are made, a minimum 25 twists/meter for all MOST 50 circuits.
- MOST 50 has specific receive and transmit I/O.

The transmit of one module is connected to receive of the next module in ring topology.

HEATED OXYGEN SENSOR WIRING REPAIRS

CAUTION: Do not solder repairs under any circumstances as this could result in the air reference being obstructed.

If the heated oxygen sensor pigtail wiring, connector, or terminal is damaged the entire oxygen sensor assembly must be replaced. Do not attempt to repair the wiring, connector, or terminals. In order for the sensor to function properly it must have a clean air reference. This clean air reference is obtained by way of the oxygen sensor signal and heater wires. Any attempt to repair the wires, connectors or terminals could result in the obstruction of the air reference and degrade oxygen sensor performance.

The following guidelines should be used when servicing the heated oxygen sensor:

- Do not apply contact cleaner or other materials to the sensor or vehicle harness connectors. These materials may get into the sensor, causing poor performance. Also, the sensor pigtail and harness wires must not be damaged in such a way that the wires inside are exposed. This could provide a path for foreign materials to enter the sensor and cause performance problems.
- Neither the sensor nor vehicle lead wires should be bent sharply or kinked. Sharp bends, kinks, etc., could block the reference air path through the lead wire.
- Do not remove or defeat the oxygen sensor ground wire (where applicable). Vehicles that utilize the ground wire sensor may rely on this ground as the only ground contact to the sensor. Removal of the ground wire will also cause poor engine performance.
- To prevent damage due to water intrusion, be sure that the peripheral seal remains intact on the vehicle harness connector.

HIGH TEMPERATURE WIRING REPAIRS

NOTE: All wiring repairs need to be 200 mm from the heat zone. Areas of consideration would be any area located near the exhaust manifolds, catalytic converter, exhaust pipes, and turbocharged engines.

Items Required

- DuraSeal splice sleeves to crimp and seal connections
- High temperature SCT1 shrink tubing to protect the splice sleeves
- Terminated leads or pigtails
- The correct tools to remove the terminals from the connectors

Use high temperature bulk wire rated at 150°C (302°F) continuous temperature of the same or larger gauge size as the original wire when repair damage wire. Also replace any reflective tape that you remove during the repair.

High Temperature Wiring

Wiring that is exposed to high temperatures, 135°C (275°F) or higher, for prolonged periods of time may use materials i.e. wires, connectors, and shielding that has a higher heat rating than typical wiring. When making a repair in a high temperature area observe the following:

- Use high temperature bulk wire rated at 150°C (302°F) continuous temperature to replace any

damaged wire.

- Replace any heat shielding that is removed.
- Cover any DuraSeal splice sleeves with SCT1 shrink tubing.
- After making a wiring repair, ensure that the location of the wiring is not moved closer to the heat source.

Identifying High Temperature Wiring

NOTE: High temperature areas would be areas located near exhaust manifolds, catalytic converters, exhaust pipes, and turbocharged engines.

Wiring that is exposed to high temperature, 135Â°C (275Â°F) or higher, for prolonged periods of time need special considerations when making wiring repairs. Areas that may be exposed to higher temperatures can be identified by heat resistant materials that are being used in those areas. These materials may include heat reflective tape and high temperature shrink tubing. Also conduit and other protective coverings may be used. Because conduit or similar coverings are used throughout the vehicle regardless of the temperature, it may be necessary for the technician to determine if an area is exposed to excessive heat before making a wiring repair.

SIR/SRS WIRING REPAIRS

NOTE: Refer to [SIR Service Precautions](#) .

For European Regions

CAUTION: If the SIR/SRS wiring, connector, or terminal is damaged, the affected wiring harness must be replaced. Do not attempt to repair the wiring, connector, or terminals. Any attempt to repair the wires, connectors, or terminals could result in performance problems of the SIR/SRS System. Operations on restraint systems must only be performed by trained and qualified personnel.

For Non-European Regions

Special Tools

Splice Sleeve Crimping Tool, refer to [Special Tools](#) .

The Supplemental Inflatable Restraint (SIR) System/Supplemental Restraint System (SRS) requires special wiring repair procedures due to the sensitive nature of the circuitry. Follow the specific procedures and instructions when working with the SIR/SRS, and the wiring components, such as connectors and terminals.

SIR/SRS Connector Repair (Plastic Body and Terminal Metal Pin)

NOTE: Do not use the terminals in the kit in order to replace damaged SIR/SRS system terminals. Use either an SIR/SRS pigtail or a terminated lead from the SIR Repair Kit Tray.

The terminals in the SIR/SRS system are made with a special plating. This plating provides the necessary contact integrity for the sensitive, low energy circuits.

Pigtail repair packs are available for SIR/SRS connectors with eight or less terminals. Only the connector body is available for connectors with more than eight terminals. Terminated leads can be used to replace damaged terminals when replacing the connector body.

SIR/SRS Component Wire Pigtail Repair

NOTE: Do not make wire, connector, or terminal repairs on components with wire pigtails.

A wire pigtail is a wire or wires attached directly to the device, not by a connector. If a wiring pigtail is damaged, you must replace the entire component, with pigtail. The inflatable restraint steering wheel module coil is an example of a pigtail component.

SIR/SRS Wire Repair

CAUTION: Do not install more than 2 DuraSeal splice sleeves per SIR deployment loop. A deployment loop consists of both wires from the K36 Inflatable Restraint Sensing and Diagnostic Module to the deployable component. If more than 2 DuraSeal splice sleeves are required for any SIR deployment loop, the complete circuit of the loop must be replaced. More than 2 DuraSeal splice sleeves per deployment loop may increase the resistance in the circuit causing a DTC to be set.

NOTE: Refer to Wiring Repairs in the service information connector end views or the vehicle schematics in order to determine the correct wire size for the circuit you are repairing. You must obtain this information in order to ensure circuit integrity.

If any wire except the pigtail is damaged, repair the wire by splicing in a new section of wire of the same gauge size (0.5 mm, 0.8 mm, 1.0 mm etc.). Use the DuraSeal splice sleeves and the appropriate splice sleeve crimping tool. For wiring repair, refer to [Wire to Wire Repair](#).

For connector position assurance (CPA), refer to [Connector Position Assurance Locks](#).

For terminal position assurance (TPA), refer to [Terminal Position Assurance Locks](#).

SPLICING INLINE HARNESS DIODES

Many vehicle electrical systems use a diode to isolate circuits and protect the components from voltage spikes. When installing a new diode use the following procedure.

1. Open the harness.
 - If the harness is taped, remove the tape.
 - To avoid wiring insulation damage, use a sewing seam ripper (available from sewing supply stores) in order to cut open the harness.
 - If the harness has a black plastic conduit, pull out the diode.
2. If the diode is taped to the harness, remove all of the tape.
3. Check and record the current flow direction and orientation of diode.
4. Remove the inoperative diode from the harness with a suitable soldering tool.

NOTE: If the diode is located next to a connector terminal remove the terminal(s) from the connector to prevent damage from the soldering tool.

5. Carefully strip away a section of insulation next to the old soldered portion of the wire(s). Do not remove

any more than is needed to attach the new diode.

6. Check current flow direction of the new diode, being sure to install the diode with correct bias. Reference the appropriate service manual wiring schematic to obtain the correct diode installation position.
7. Attach the new diode to the wire(s) using 60/40 rosin core solder. Before soldering attach some heat sinks (aluminum alligator clips) across the diode wire ends to protect the diode from excessive heat. Follow the manufacturer's instruction for the soldering equipment.
8. Reinstall terminal(s) into the connector body if previously removed.

NOTE: To prevent shorts to ground and water intrusion, completely cover all exposed wire and diode attachment points with tape.

9. Tape the diode to the harness or connector using electrical tape.

SPLICING TWISTED OR SHIELDED CABLE

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

Twisted/shielded cable is used in order to protect wiring from electrical noise. Two-conductor cable of this construction is used between the radio and the Delco-Bose® speaker/amplifier units and other applications where low level, sensitive signals must be carried. Follow the instructions below in order to repair the twisted/shielded cable.

Fig. 11: View Of Outer Wiring Jacket

Courtesy of GENERAL MOTORS COMPANY

1. Remove the outer jacket (1). Use care not to cut into the drain wire of the mylar tape.
2. Unwrap the tape. Do not remove the tape. Use the tape in order to rewrap the twisted conductors after the splice is made.

Fig. 12: Preparing The Splice

Courtesy of GENERAL MOTORS COMPANY

3. Prepare the splice. Untwist the conductors and follow the instructions for [Wire to Wire Repair](#). Staggering the splices by 65 mm (2.5 in) is recommended.

Fig. 13: Identifying Diode On Wire

Courtesy of GENERAL MOTORS COMPANY

NOTE: **Apply the mylar tape with the aluminum side inward. This ensures good electrical contact with the drain wire.**

4. Re-assemble the cable.

- Rewrap the conductors with the mylar tape. If the mylar tape is damaged, use 3M product AL-36FR to replace the damaged mylar tape.
- Use caution not to wrap the drain wire in the tape (1).
- Follow the splicing instructions for copper wire and splice the drain wire.
- Wrap the drain wire around the conductors and tape with electrical tape to replace the outer insulation.

Fig. 14: View Of Repaired Wire Covered With Electrical Tape
Courtesy of GENERAL MOTORS COMPANY

5. Tape over the entire cable. Use a winding motion when you apply the tape.

WIRE TO WIRE REPAIR

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool
- **EL-38125-5** Ultra Torch Special Tool
- DuraSeal splice sleeves, in order to repair the SIR/SRS wiring

For equivalent regional tools, refer to [Special Tools](#) .

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not

repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: Do not splice wires in Door Harness Grommets.

NOTE:

- Use only DuraSeal splice sleeves. Other splice sleeves may not protect the splice from moisture or provide a good electrical connection.
- For wire Gauge smaller than .5 mm (18 gauge) refer to [Folded-Over Wire Repair](#)

Use DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19168446	Red (1) or Red/Green (1)	Red (2)	0.5 - 0.8/(18 - 20)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.6/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:
 - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
 - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
 - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:

- When adding a length of wire to the existing harness, use the same size wire as the original wire.
 - Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
 - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
 - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
 - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

Fig. 15: Splice Sleeve Crimping Tool With 4 Crimp Nests
Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for

crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

Fig. 16: Splice Sleeve Crimping Tool With 3 Crimp Nests
Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

Fig. 17: Identifying Duraseal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 18: Crimped Duraseal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 19: Crimped Duraseal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

12. Using the EL-38125 - 5 ultra torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [Folded-Over Wire Repair](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.

Fig. 20: Tightly Close Handles Of Crimp Tool
Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSEAL with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

Fig. 21: Heat To Crimped Area Of Barrel

Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Fig. 22: Taping Extra Terminated Leads Back Into Harness
Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the EL-38125 - 5 ultra torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR POSITION ASSURANCE LOCKS

The connector position assurance (CPA) is a small plastic insert that fits through the locking tabs of the connector. CPAs are used in various connectors throughout the vehicle. CPAs are also used in all SIR system electrical connectors. The CPA ensures that the connector halves cannot vibrate apart. You must have the CPA in place in order to ensure good contact between the mating terminals of the connector.

TERMINAL POSITION ASSURANCE LOCKS

The terminal position assurance (TPA) insert resembles the plastic combs used in the control module connectors. The TPA keeps the terminal securely seated in the connector body. Do not remove the TPA from the connector body unless you remove a terminal for replacement. If the TPA is removed, be sure to reinstall it before reconnecting the connector.

AFL/EPC CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool
- **J-38125-216** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

Fig. 23: View Of Bolt On Connector Cover
Courtesy of GENERAL MOTORS COMPANY

Fig. 24: Identifying Connector Position Assurance (CPA)

Courtesy of GENERAL MOTORS COMPANY

1. For connectors with a bolt in the dress cover, turn the bolt counterclockwise to remove the connector from the component.
2. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

Fig. 25: Identifying Lever Lock & Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

3. Slide the lever lock forward while pressing down on the lever lock release tab.

Fig. 26: View Showing Depressing Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

4. View showing depressing of the lever lock release tab.

Fig. 27: View of connector in released position
Courtesy of GENERAL MOTORS COMPANY

5. View of connector in released position.
6. Disconnect the connector from the component.
7. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

Fig. 28: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

8. Release the rear lower half of the wiredress cover.

Fig. 29: Identifying Tabs Holding Wiredress Cover

Courtesy of GENERAL MOTORS COMPANY

9. Release the tabs that are holding the wiredress cover to the connector body.
10. Remove the nose piece by inserting a small flat-blade tool into the slots on both ends of the connector body. Gently pry the nose piece out of the connector. J-38125-216 can also be used to remove the nose piece.

Fig. 30: Lifting Terminal Retaining Tabs

Courtesy of GENERAL MOTORS COMPANY

11. Use the J-38125-12A tool to release the terminals by lifting the terminal retaining tabs on the inside of the connector.

Fig. 31: Pulling Wire Out Of Back Of Connector

Courtesy of GENERAL MOTORS COMPANY

12. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
13. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (BSK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-561** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

1. Disconnect the connector from the component.
2. Remove the wire dress cover, if necessary.
3. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

Fig. 32: View Of Bosch Connector Terminals (BSK)

Courtesy of GENERAL MOTORS COMPANY

4. Insert the J-38125-561 tool into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
5. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (0.64)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit

- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-560** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

1. Locate the lever lock on the wire dress cover. While pressing the lock, pull the lever over and past the lock until the lever is at the end of its travel.
2. Disconnect the connector from the component.
3. Pull the rubber boot that covers the wires back to expose the end of the connector dress cover.
4. Place the connector locking lever in the center of the connector.

Fig. 33: View Of Flat-Bladed Tool Being Inserted Between Cover & Connector Body
Courtesy of GENERAL MOTORS COMPANY

5. Locate the 2 dress cover locking tabs that are on the wire end of the connector. Insert a small flat-bladed tool between the cover and connector body and pry up.

Fig. 34: View Of Flat-Bladed Tool Between Cover & Connector End
Courtesy of GENERAL MOTORS COMPANY

6. Locate the 2 dress cover locking tabs located on the opposite side of the connector. Insert a small flat-bladed tool between the cover at the connector end and pry up.
7. Remove the dress cover.
8. Cut the tie wrap on the wire bundle.

Fig. 35: View Of Terminal Position Assurance (TPA)

Courtesy of GENERAL MOTORS COMPANY

9. Remove the terminal position assurance (TPA) by inserting a small flat-bladed tool into the small slot in the end of the slider and pushing on the TPA until it comes out of the connector. When the TPA exits the opposite side of the connector, grasp the TPA and pull it completely out of the connector.
10. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

Fig. 36: View Of J 38125-560 Being Inserted Into Triangular Cavities
 Courtesy of GENERAL MOTORS COMPANY

11. Insert the J-38125-560 into the 2 triangular cavities on each side of the terminal at the front of the connector.
12. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
13. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)Repairing Connector Terminals (Terminal Repair) procedure.
14. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

Fig. 37: Aligning Coding Lugs With Connector Coding Grooves

Courtesy of GENERAL MOTORS COMPANY

1. Prior to installation the terminal must be aligned so the (1) coding lugs align with the (2) coding grooves on the connector.
2. Once the terminal is aligned, slide the terminal into the cavity until the retainer has engaged in the cavity of the connector.
3. Slide the TPA in the connector body and seat it using a small flat bladed tool. The TPA is seated when it is flush with the contact housing.
4. Secure the wires to the connector body using a tie wrap and replace the dress cover and grommet.

BOSCH CONNECTORS (2.8 JPT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-557** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

1. Pull out the slider on the connector position assurance (CPA) until it is at the end of its travel.
2. Disconnect the connector from the component.
3. Remove the wire dress cover, if necessary.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

Fig. 38: Bosch Connector Terminals

Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-557 into the 2 cavities on each side of the terminal at the front of the connector and push until you feel the tool disengage the terminal retainers.
6. Carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#) procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

BOSCH CONNECTORS (ECM)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-213** Terminal Release Tool
- **J-38125-556** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

Fig. 39: View Of Bosch Connectors

Courtesy of GENERAL MOTORS COMPANY

1. Locate the assist lever on the top of the connector. Move the assist lever to the forward position.

Fig. 40: Identifying Assist Lever In Forward Position
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the connector from the component.

Fig. 41: View Of Releasing Locking Tabs

Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs at the corners of the connector. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

Fig. 42: View Of Terminal Positive Assurance (TPA) Connector

Courtesy of GENERAL MOTORS COMPANY

4. The terminal positive assurance (TPA) is located in the front of the connector.

Fig. 43: View Of Removing TPA From Connector
Courtesy of GENERAL MOTORS COMPANY

5. Use a small flat-blade tool to remove TPA from the connector.

Fig. 44: View Of Special Tools And Terminals
Courtesy of GENERAL MOTORS COMPANY

6. Use the J-38125-213 or the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity.
7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#) procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

NOTE: Ensure that the dress cover and connector body are both in the released position before reassembling. Failure to do so may cause damage to the connector and component.

10. Reconnect the connector bodies.

DELPHI CONNECTORS (WEATHER PACK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-10A** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

The following is the proper procedure for the repair of Weather Pack® Connectors.

Fig. 45: View Of Connector Halves

Courtesy of GENERAL MOTORS COMPANY

1. Separate the connector halves (1).
2. Open the secondary lock. A secondary lock aids in terminal retention and is usually molded to the connector (1).
3. Grasp the wire and push the terminal to the forward most position. Hold the wire in this position.

Fig. 46: Identifying Removal Tool & Terminal
 Courtesy of GENERAL MOTORS COMPANY

4. Insert the Weather Pack® terminal removal tool J-38125-10A into the front (mating end) of the connector cavity until it rests on the cavity shoulder (1).
5. Gently pull on the wire to remove the terminal through the back of the connector (2).

NOTE: **Never use force to remove a terminal from a connector.**

6. Inspect the terminal and connector for damage. Repair as necessary. Refer to [Repairing Connector Terminals \(Terminated Lead Repair\)](#) [Repairing Connector Terminals \(Terminal Repair\)](#).
7. Reform the lock tang (2) and reset terminal in connector body.
8. Close secondary locks and join connector halves.
9. Verify that circuit is complete and working satisfactorily.
10. Perform system check.
11. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead](#)

Repair)Repairing Connector Terminals (Terminal Repair) procedure.

12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (PUSH TO SEAT)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

Follow the steps below in order to repair push to seat connectors.

1. Remove the terminal position assurance (TPA) device, the connector position assurance (CPA) device, and/or the secondary lock.

Fig. 47: View Of Connector Halves
Courtesy of GENERAL MOTORS COMPANY

2. Separate the connector halves (1).

Fig. 48: Identifying Removal Tool & Terminal
Courtesy of GENERAL MOTORS COMPANY

3. Use the proper pick or removal tool (1) in order to release the terminal.
4. Gently pull the cable and the terminal (2) out of the back of the connector.

Fig. 49: Identifying Locking Device

Courtesy of GENERAL MOTORS COMPANY

5. Re-form the locking device if you are going to reuse the terminal (1).
6. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. In order to reuse a terminal or lead assembly, refer to [Wiring Repairs](#) .
2. Ensure that the cable seal is kept on the terminal side of the splice.
3. Insert the lead from the back until it catches.
4. Install the TPA, CPA, and/or the secondary locks.

DELPHI CONNECTORS (PULL TO SEAT)

Special Tools

- EL-38125-550 Terminal Release Tool Kit

- **EL-38125-580** Terminal Release Tool Kit

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

If the terminal is visibly damaged or is suspected of having a faulty connection, the terminal should be replaced.

Fig. 50: Aligning Removal Tool - Delphi (Pull To Seat)

Courtesy of GENERAL MOTORS COMPANY

Follow the steps below in order to repair pull-to-seat connectors:

1. Remove the connector position assurance (CPA) device and/or the secondary lock.
2. Disconnect the connector from the component or separate the connectors for in-line connectors.
3. Remove the terminal position assurance (TPA) device.
4. Review the connector end view to determine the proper test probe and release tool.
5. Insert the release tool into the front of the connector body.
6. Grasp the wire at the back of the connector body and gently push the terminal out the front of the connector body.

7. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

1. Align the terminal and pull the wire from the back of the connector in order to seat the terminal.
2. If the connector is outside of the passenger compartment, apply dielectric grease to the connector.
3. Install the TPA, CPA, and/or the secondary locks.

DELPHI CONNECTORS (MICRO-PACK 100W)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

There are 2 styles of Micro-Pack 100W connectors. These connectors are very similar but use different terminals and have some minor physical differences also.

Fig. 51: Identifying Micro-Pack 100W First & Second Connector Designs

Courtesy of GENERAL MOTORS COMPANY

The first connector design of the Micro-Pack 100W (1) has a white connector interface that holds the terminals. The second design of the Micro-Pack 100W (2) has a gray interface to hold the terminals. Also, the first design has terminal cavities that are further apart (3 mm centerline) and offset from the other row of terminal cavities in the connector. The second design has terminals cavities that are closer together (2.54 mm centerline) and aligned vertically. One other way to identify the second design is the thin strip of material that runs along the outside of the cavities.

Fig. 52: Identifying Micro-Pack 100W Short & Long Terminals

Courtesy of GENERAL MOTORS COMPANY

NOTE: There are 2 styles of Micro-Pack 100W terminals which are very similar. Ensure that you have the correct terminal before crimping the new terminal to the wire. The first design connector uses the longer terminal (1) that has a raised area in front of the recess in the terminal. The second design connector uses the shorter terminal without the raised area.

Follow the steps below in order to remove terminals from Micro-Pack 100W connectors. Some Micro-Pack 100W connector disassembly procedures will vary. Use this procedure as a guide.

1. Disconnect the connector from the component.

Fig. 53: Locating Nose Piece Locking Tabs

Courtesy of GENERAL MOTORS COMPANY

2. Locate the nose piece locking tabs that are positioned on the side of the connector nose piece. The connector nose piece acts as a terminal positive assurance (TPA) and may be referred to as such.

Fig. 54: Loosening Nose Piece Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-blade tool to push in one of the locking tabs while gently pulling on the same side of the nose piece.
4. Repeat the procedure for the other locking tab and remove the nose piece.
5. Remove the wire dress cover. The following is a general procedure for wire dress cover removal. Use this procedure as a guide, some dress cover removal procedures may vary.

Fig. 55: Squeezing Cover Locking Legs
Courtesy of GENERAL MOTORS COMPANY

6. Use fingers to squeeze the 2 locking legs of the cover.

Fig. 56: Unseating Locking Leg

Courtesy of GENERAL MOTORS COMPANY

7. Apply pressure and gently rock the cover until one locking leg is unseated.

Fig. 57: Removing Cover

Courtesy of GENERAL MOTORS COMPANY

8. Continue to apply pressure and rock the cover until the second locking leg is unseated. Repeat procedure for the other side of the dress cover and remove the cover.

Fig. 58: Identifying Terminal Retaining Tab
 Courtesy of GENERAL MOTORS COMPANY

9. Use J-38125-12A to gently lift the terminal retaining tab while gently pulling the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
10. If the terminal is severely bent or damaged, it may be possible on some connectors to push the wire out of the front of the connector instead of pulling it through. This will prevent damage to the internal seals of the connector. Once the terminal is pushed out of the connector, cut the wire as close to the terminal as possible and pull the wire through the connector.
11. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is crimped to the wire perform the following procedure in order to replace Micro-Pack 100 terminals.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the

other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.

3. To assemble the connector, reverse the Terminal Removal Procedure.

DELPHI CONNECTORS (MICRO.64)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-21** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from Micro.64 connectors.

Fig. 59: Identifying Wire Dress Cover Lever Lock
Courtesy of GENERAL MOTORS COMPANY

Fig. 60: View Of Typical Micro 64 Connector
Courtesy of GENERAL MOTORS COMPANY

Fig. 61: Depressing Lock And Pulling Lever

Courtesy of GENERAL MOTORS COMPANY

Fig. 64: Locating Locks On Both Sides Of Wiredress Cover
Courtesy of GENERAL MOTORS COMPANY

Fig. 65: View Of Connector When Released From Component
Courtesy of GENERAL MOTORS COMPANY

1. Locate the lever lock on the wire dress cover. While depressing the lock, pull the lever over and past the lock. The lever lock may be located on the top or sides of the wire dress cover.

View of a typical Micro 64 connector.

Depress the lock and pull the lever over and past the lock.

View of the connector when released from the component.

View of another type of Micro 64 connector.

Depress the locks that are located on both sides of the wire dress cover and pull the lever over and past the locks.

View of the connector when released from the component.

2. Disconnect the connector from the component.

Fig. 66: View Of Releasing Locking Tabs

Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs at the front of the connector. Using a small flat-blade tool push down on one of the locking tabs and pull the cover up until the dress cover releases. Repeat this procedure for the other locking tab.
4. Once the front 2 locks are unlocked, lift the front of the dress cover and pull it forward.

Fig. 67: View Of Removing Terminal Position Assurance

Courtesy of GENERAL MOTORS COMPANY

NOTE: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

5. Remove the TPA by inserting a small flat-blade tool into the small slot on the TPA and pushing down until the TPA releases. Gently pry the TPA out of the connector.

Fig. 68: Identifying Terminal Release Tool

Courtesy of GENERAL MOTORS COMPANY

NOTE: Be careful not to angle or rock the J-38125-21 tool when inserting it into the connector or the tool may break.

6. Insert the J-38125-21 tool into the round canal between the terminals cavities at the front of the connector.

Fig. 69: Removing Wire From Back Of Connector

Courtesy of GENERAL MOTORS COMPANY

7. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (12-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-12A** Terminal Release Tool

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

Fig. 70: Identifying Lever Lock

Courtesy of GENERAL MOTORS COMPANY

1. Locate the lever lock on the wire dress cover. Remove the connector position assurance (CPA) and slide the lever lock away from the connector body.
2. Disconnect the connector from the component.

Fig. 71: Identifying Dress Cover Locking Tabs
Courtesy of GENERAL MOTORS COMPANY

3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-blade tool release all of the locking tabs.

Fig. 72: Identifying Lower Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

4. Release the lower wire dress cover locking tab.

Fig. 73: Identifying Upper Wire Dress Cover Locking Tab
Courtesy of GENERAL MOTORS COMPANY

5. Release the upper wire dress cover locking tab.
6. Once the locks are unlocked, lift the dress cover off.

Fig. 74: View Of TPA Being Pried Out Of Connector

Courtesy of GENERAL MOTORS COMPANY

NOTE: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

7. Remove the TPA by inserting a small flat-blade tool into the locking tabs on both sides of the TPA. Gently pry the TPA out of the connector.

Fig. 75: View Of Nose Piece

Courtesy of GENERAL MOTORS COMPANY

8. Remove the nose piece by inserting a small flat-blade tool into the locking tabs on both sides of the nose piece. Gently pry the nose piece out of the connector.

Fig. 76: Inserting Special Tool Into Terminal Release Cavity

Courtesy of GENERAL MOTORS COMPANY

9. Insert the J-38125-12A tool to release the terminals by inserting the tool into the terminal release cavity.

Fig. 77: Pulling Wire Out Of Back Of Connector

Courtesy of GENERAL MOTORS COMPANY

10. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
11. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
12. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

DELPHI CONNECTORS (STEERING GEAR)

Removal Procedure

Fig. 78: Releasing Locking Tab On Connector
Courtesy of GENERAL MOTORS COMPANY

1. Use a small flat-bladed tool to release the locking tab on the connector.

Fig. 79: Releasing Connector

Courtesy of GENERAL MOTORS COMPANY

2. Push down the locking tab to release the connector. The small flat-bladed tool may need to be pushed down and angled back slightly to depress the locking tab. Pull on the connector body while releasing the locking tab to disconnect the connector.

FCI CONNECTORS (LEVER LOCK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-556** Terminal Release Tool
- **J-38125-560** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

Fig. 80: Identifying Release Tab

Courtesy of GENERAL MOTORS COMPANY

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. The release tab is located on the top of the wiredress cover.

Fig. 81: View Of Connector In Released Position
Courtesy of GENERAL MOTORS COMPANY

3. View of connector in released position.
4. Disconnect the connector from the component.
5. Locate the dress cover locking tabs at the corners of the dress cover. Use a small flat-blade tool to release the locking tabs and remove the dress cover.

Fig. 82: View Of Sliding Terminal Position Assurance (TPA) Up One Notch
Courtesy of GENERAL MOTORS COMPANY

6. Use a small flat-blade tool to slide the terminal position assurance (TPA) up one notch on both ends of the connector. The TPA is located underneath the wire dress cover.

Fig. 83: View Of Releasing Terminals

Courtesy of GENERAL MOTORS COMPANY

7. For the larger terminals insert the J-38125-556 tool to release the terminals by inserting the tool into the terminal release cavity. For the smaller terminals insert the J-38125-560 tool to release the terminals by inserting the tool into the terminal release cavity.

Fig. 84: View Of Wire Being Pulled Out Of Back Of Connector While Holding Removal Tool In Place

Courtesy of GENERAL MOTORS COMPANY

8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

FCI CONNECTORS (SIR)

Removal Procedure

NOTE: The orange or yellow connector position assurance (CPA) must be released first to disconnect or to connect the connector.

Fig. 85: Lifting Orange CPA

Courtesy of GENERAL MOTORS COMPANY

1. Lift the orange or yellow CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

Fig. 86: Grabbing Connector On Both Sides
Courtesy of GENERAL MOTORS COMPANY

2. Grab the connector on both sides and lift vertically to disconnect the connector.

Installation Procedure

Fig. 87: Lifting Orange CPA

Courtesy of GENERAL MOTORS COMPANY

1. The CPA should be approximately 4 mm above the yellow cover before installing the connector. If not, use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

Fig. 88: Seating Connector Sub-Assembly

Courtesy of GENERAL MOTORS COMPANY

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push down into the initiator connector sub assembly until fully seated.

Fig. 89: Pushing CPA Down

Courtesy of GENERAL MOTORS COMPANY

3. After the connector is fully seated, push the CPA down with your thumb until the CPA is touching the yellow cover on the connector.
4. After the CPA is seated, lightly pull on the connector, it should not pull off if the connector and CPA are properly engaged.

FEP CONNECTORS (STEERING GEAR)

Removal Procedure

Fig. 90: Releasing Locking Tab On Connector
Courtesy of GENERAL MOTORS COMPANY

1. Use a flat-bladed tool to release the locking tab on the connector.

Fig. 91: Twisting Flat-Bladed Tool To Push Top Of Locking Tab Inward
Courtesy of GENERAL MOTORS COMPANY

2. Option 1: Twist the flat-bladed tool to push the top of the locking tab inward while pulling the connector body out.

Fig. 92: Using Flat-Bladed Tool To Depress Locking Tab

Courtesy of GENERAL MOTORS COMPANY

3. Option 2: Pry using the flat-bladed tool to depress the locking tab while pulling the connector body out.

JST CONNECTORS

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-553** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

The JST connector family consists of seven unique connector housings differentiated by color and keying. This connector family is designed to use both 0.64 and 2.8 sized terminals.

JST BCM Connector

GM Service Part #	Color
-------------------	-------

GM Service Part #	Color
88988806	Gray
88988837	Brown
88988838	Lt Green
88988839	Natural
88988840	Lt Blue
88988841	Black
88988842	Pink

Fig. 93: Identifying Terminal Position Assurance (TPA)

Courtesy of GENERAL MOTORS COMPANY

1. While depressing the lock, remove the connector from the component.

Fig. 94: Identifying TPA On Both Sides Of Connector
Courtesy of GENERAL MOTORS COMPANY

2. Unlock the terminal position assurance (TPA):
 - Position connector as shown (above) and locate TPA staging cavities.

Fig. 95: Terminal Release Tool

Courtesy of GENERAL MOTORS COMPANY

- Using connector terminal release tool J-38125-553 (1) lift the TPA into the staged position. Perform this step on both sides of the TPA.

Fig. 96: TPA In Staged Position

Courtesy of GENERAL MOTORS COMPANY

- You will feel the TPA click into place when fully extended into the staged position. The figure above shows the TPA (1) in the staged position.

Fig. 97: Connector Terminal Release Tool

Courtesy of GENERAL MOTORS COMPANY

3. Release the terminal from the connector:

- Position the connector as shown (above) and locate the terminal release entry canal (1) of the suspect terminal.
- Insert the connector terminal release tool J-38125-553 into the entry canal with the angled side of the tool facing the connector wall containing cavity 4 (2).

Fig. 98: Connector Lance And TPA

Courtesy of GENERAL MOTORS COMPANY

- The cavity on the left (1) is a 2.8 mm² cavity and the cavity on the right (2) is a 0.64 mm² cavity.
 - Place the tip of the connector terminal release tool onto the connector lance (3) and deflect the lance to the right (5) to release the lock. Hold this released position.
 - Holding the lance in the released position, slightly pull on the suspect terminal to remove it from the connector housing. The side TPA (4) is a secondary lock.
4. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#) procedure.
 5. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

KOSTAL CONNECTORS (GLOW PLUG CONTROL MODULE)

Special Tools

- EL-38125-550 Terminal Release Tool Kit
- EL-38125-580 Terminal Release Tool Kit

Courtesy of GENERAL MOTORS COMPANY

2. Locate the terminal position assurance (TPA).

Fig. 108: View Of TPA & Flat-Bladed Tool

Courtesy of GENERAL MOTORS COMPANY

NOTE: The TPA cannot be removed from the connector while there are terminals present in the connector body.

3. Use a small flat-blade tool to push the TPA until it bottoms out.

Fig. 109: Using J 38125-28 Tool To Release Terminals

Courtesy of GENERAL MOTORS COMPANY

4. Use the J-38125-28 tool to release the terminals by inserting the tool into the terminal cavity as shown in the graphic.
5. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the [**Repairing Connector Terminals \(Terminated Lead Repair\)**](#) procedure.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.

Fig. 110: Locating Terminal Position Assurance (TPA)
Courtesy of GENERAL MOTORS COMPANY

3. Locate the TPA.

Fig. 111: View Of TPA & Flat-Bladed Tool

Courtesy of GENERAL MOTORS COMPANY

4. Use a small flat-blade tool to push the TPA until it bottoms out.

Fig. 112: View Of Terminal Position Assurance (TPA)

Courtesy of GENERAL MOTORS COMPANY

5. Ensure the TPA is fully seated. The TPA should be centered and flush with the connector body when viewed.

MOLEX CONNECTORS (LEVER LOCK)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-213** Terminal Release Tool

For equivalent regional tools, refer to [**Special Tools**](#) .

Terminal Removal Procedure

1. Locate the connector position assurance (CPA) on the top of the wire dress cover. Slide the CPA forward.

Fig. 113: Identifying Lever Lock Release Tab
Courtesy of GENERAL MOTORS COMPANY

2. Slide the lever lock forward while pressing down on the lever lock release tab.

Fig. 114: View Of Lever In Full Forward Position
Courtesy of GENERAL MOTORS COMPANY

3. The lever should be in the full forward position.

Fig. 115: View Of CPA Connector

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the connector from the component.

Fig. 116: View Of Dress Cover

Courtesy of GENERAL MOTORS COMPANY

5. Remove the dress cover by using a flat bladed tool to release the dress cover locking tabs and lift up on the dress cover.
6. Cut the tie wrap that holds the wires to the connector body.

Fig. 117: Prying One Side Of Nose Piece

Courtesy of GENERAL MOTORS COMPANY

7. Use a small flat-blade tool to pry one side of the nose piece up to the pre-stage position. When the nose piece is in the pre-staged position, the nose piece will be raised above the connector body the length of the step in the nose piece.

Fig. 118: Prying Side Of Nose Piece

Courtesy of GENERAL MOTORS COMPANY

8. Use a small flat-blade tool to pry the other side of the piece to the pre-stage position. If the nose piece is higher than the first step in the nose piece, gently push down on the nose piece until it meets with resistance from the connector body, you should feel the nose piece click into position.

Fig. 119: Releasing Terminal

Courtesy of GENERAL MOTORS COMPANY

9. Insert the J-38125-213 into the small terminal release hole on the nose piece and gently pull on the back of the wire.
10. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminated Lead Repair

1. Remove the terminal.
2. Find the appropriate terminated lead.
3. Use the appropriate splice sleeves depending on the gauge size.
4. Refer to [Wire to Wire Repair](#).

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Insure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

MOLEX CONNECTORS (SIR)

Removal Procedure

NOTE: The orange or yellow connector position assurance (CPA) must be released first to disconnect or to connect the connector.

Fig. 120: Lifting Orange CPA

Courtesy of GENERAL MOTORS COMPANY

1. Lift the orange or yellow CPA vertically (avoid lifting on an angle to the connector) approximately 4 mm to release the connector. Use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

Fig. 121: Grabbing Connector On Both Sides
Courtesy of GENERAL MOTORS COMPANY

2. Grab the connector on both sides and lift vertically to disconnect the connector.

Installation Procedure

Fig. 122: Lifting Orange CPA

Courtesy of GENERAL MOTORS COMPANY

1. The CPA should be approximately 4 mm above the yellow cover before installing the connector. If not, use a small flat-bladed tool to help release the CPA. The CPA may also be released manually without any tools.

Fig. 123: Seating Connector Sub-Assembly

Courtesy of GENERAL MOTORS COMPANY

2. Line up the connector key tabs with the initiator key slots. Grab the connector on both sides and push down into the initiator connector sub assembly until fully seated.

Fig. 124: Pushing CPA Down

Courtesy of GENERAL MOTORS COMPANY

3. After the connector is fully seated, push the CPA down with your thumb until the CPA is touching the yellow cover on the connector.

SUMITOMO CONNECTORS

Terminal Removal Procedure

Fig. 125: Identifying Lever Lock

Courtesy of GENERAL MOTORS COMPANY

Fig. 126: View Of Lever Lock In Forward Position

Courtesy of GENERAL MOTORS COMPANY

1. Slide the lever lock forward while pressing down on the lever lock release tab.
2. Disconnect the connector from the component.

Fig. 127: View Of Connector Locking Tabs

Courtesy of GENERAL MOTORS COMPANY

3. Remove the dress cover by using a flat-blade tool to release the connector locking tabs and pulling off the dress cover.

Fig. 128: Identifying Nose Piece Locking Tabs

Courtesy of GENERAL MOTORS COMPANY

4. Relieve the tension on the nose piece retainers by inserting J-38125-12A into the single retainer slot on the end of the nose piece and gently prying out the locking tab. Repeat the process for both of the nose piece locking tabs on the opposite side of the nose piece.

Fig. 129: Pulling Up One End Of Nose Piece (1st Side)

Courtesy of GENERAL MOTORS COMPANY

5. Once the nose piece retainers are relaxed, use the J-38125-552 to pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should raise slightly.

Fig. 130: Pulling Up One End Of Nose Piece (2nd Side)

Courtesy of GENERAL MOTORS COMPANY

6. On the opposite side of the nose piece, use the J-38125-552 pull up the nose piece by hooking the tool under the nose piece and pulling up. The nose piece should release completely. If the nose piece does not come off, repeat the procedure on the opposite side.

Fig. 131: View Of Terminal & Entry Canal

Courtesy of GENERAL MOTORS COMPANY

7. The illustration above identifies the entry canal where the terminal release tool will be inserted, and the terminal cavity.

- Terminal (1)
- Entry Canal (2)

Fig. 132: Inserting J-38125-553 (15315247) Tool Into Entry Canal

Courtesy of GENERAL MOTORS COMPANY

8. Insert the J-38125-553 tool into the entry canal and pry up on the terminal retainer. The terminal retainer is a small plastic piece on the top of the terminal. The terminal retainer must be held up while the terminal is pulled out of the connector.

Fig. 133: Cutaway View Of Connector

Courtesy of GENERAL MOTORS COMPANY

9. The illustration shows a cutaway view of the connector to aid the technician in releasing the terminal retainer.
10. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#) procedure.
11. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

Terminal Insertion Procedure

After the terminal is replaced, perform the following procedure in order to insert the terminal.

1. Slide the new terminal into the correct cavity at the back of the connector.
2. Push the terminal into the connector until it locks into place. The new terminal should be even with the other terminals. Ensure that the terminal is locked in place by gently pulling on the wire.
3. To assemble the connector, reverse the connector disassembly procedure.

TYCO/AMP CONNECTORS (CM 42-WAY)

- **J-38125-12A** Terminal Release Tool

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

1. Locate the connector position assurance (CPA) on the connector body and pull the CPA out. The CPA is on the wire harness side of connector.
2. Disconnect the connector from the component.

Fig. 134: View Of Dress Cover

Courtesy of GENERAL MOTORS COMPANY

3. Use a small flat-bladed tool to gently pry off the dress cover by inserting the tool under the cover opposite the harness side and prying up.
4. Remove the cover.

Fig. 135: View Of Terminal Position Assurance (TPA)

Courtesy of GENERAL MOTORS COMPANY

5. Using a small flat-bladed tool, push on the side of the nose piece retainer while pushing the nose piece forward with your thumb. This will release the terminal position assurance (TPA).

Fig. 136: Inserting Special Tool Into Terminal Release Cavity

Courtesy of GENERAL MOTORS COMPANY

6. Insert the **J-38125-12A** tool into the corresponding terminal release cavity. The release cavities are the 2 center rows of cavities on one half of the connector.

Fig. 137: Identifying Special Tool & Release Cavity

Courtesy of GENERAL MOTORS COMPANY

7. Pressing the **J-38125-12A** tool in the release cavity of the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
8. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)** procedure.
9. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (SENSOR)

For equivalent regional tools, refer to **Special Tools** .

Terminal Removal Procedure

1. Disconnect the connector from the component.

Fig. 138: View Of Inserting Special Tool Into Lower Right Face Cavity

Courtesy of GENERAL MOTORS COMPANY

2. Insert the J-38125-11A tool into the cavity on the lower right hand face of the connector until the terminal release tang access panel slides over.

Fig. 139: Pushing Wire Side Of Terminal Toward Connector
Courtesy of GENERAL MOTORS COMPANY

3. Ensure that the terminal release tang access panel is in the correct location to access the terminals.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

Fig. 140: View Of Inserting Tool Into Terminal Release Tang Access Slot (Sensor)

Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-11A into the terminal release tang access slot located behind the access panel of the connector and press down on the terminal while carefully pulling the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
6. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (0.25 CAP)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit

Terminal Removal Procedure

1. Disconnect the connector from the component by pressing down on the connector position assurance (CPA).

Fig. 141: Releasing TPA Using Small Flat-Bladed Tool

Courtesy of GENERAL MOTORS COMPANY

NOTE: The TPA on this connector cannot be removed unless the terminals are removed first. The TPA will come out of the connector body, but only slightly. When the TPA is slightly raised the terminals can be removed. Using excessive force to remove the TPA with the terminals still in the connector will damage the connector.

2. Use a small flat-bladed tool to release the terminal position assurance (TPA) by inserting the tool in the small recess on the side of the connector and pushing up until the TPA releases from the connector body. The TPA should raise just slightly. Do not try to remove the TPA.
3. Repeat the process for the other side of the connector.

Fig. 142: View Of Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

4. Ensure that the TPA is in the proper position to remove the terminals.

Fig. 143: Identifying Special Tool & Release Cavity
Courtesy of GENERAL MOTORS COMPANY

5. While pushing the terminal forward, insert the J-38125-24 in the release cavity above the terminal you are removing, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
6. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

TYCO/AMP CONNECTORS (43-WAY)

For equivalent regional tools, refer to [Special Tools](#) .

Terminal Removal Procedure

Follow the steps below in order to remove terminals from the connector.

1. Locate the lever lock on the wire dress cover. Slide the lever lock away from the connector body.
2. Disconnect the connector from the component.
3. Locate the dress cover locking tabs on the dress cover of the connector. Using a small flat-bladed tool release all of the locking tabs.
4. Once the locks are unlocked, lift the dress cover off.

Fig. 144: Releasing TPA

Courtesy of GENERAL MOTORS COMPANY

NOTE: Always use care when removing a terminal position assurance (TPA) in order to avoid damaging it.

5. Release the TPA by inserting a small flat-bladed tool into the blue locking tabs on both ends of the connector. Gently slide the TPA up to the released position on both ends.

- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-553** Terminal Release Tool

Terminal Removal Procedure

1. Disconnect the connector from the component.

Fig. 193: Identifying Terminal Position Assurance
Courtesy of GENERAL MOTORS COMPANY

2. Insert a small flat-blade tool in the slot below the front loaded terminal position assurance (TPA) and pry up.
3. Remove the TPA by pulling it out of the connector.
4. Push the wire side of the terminal that is being removed toward the connector and hold it in position.

Fig. 194: Inserting Tool Into Terminal Cavity
Courtesy of GENERAL MOTORS COMPANY

5. Insert the J-38125-553 on a slight upward angle into the cavity below the terminal to be removed. Ensure that the pointed on the end of the tool is facing the bottom of the terminal and it stays in contact with the terminal until it stops on the plastic terminal retainer.

Fig. 195: Pulling Terminal Out Of Connector
Courtesy of GENERAL MOTORS COMPANY

6. Gently pry the plastic terminal retainer down and carefully pull the terminal out of the connector. Always remember never use force when pulling a terminal out of a connector. If the terminal is difficult to remove, repeat the entire procedure.
7. Repair the terminal by following the **Repairing Connector Terminals (Terminated Lead Repair)** procedure.
8. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

YAZAKI CONNECTORS (16-WAY)

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **J-38125-215** Terminal Release Tool

For equivalent regional tools, refer to **Special Tools** .

Fig. 196: Pulling Two Connector Halves Apart
Courtesy of GENERAL MOTORS COMPANY

1. While depressing the lock, pull the two connector halves apart.

NOTE: The terminal position assurance (TPA) is fragile and may break if not done carefully.

2. Use a small flat-blade tool to very carefully push the TPA towards the face of the connector on both sides of the connector.

Fig. 197: View Of Male Connector Half & Female Terminals
Courtesy of GENERAL MOTORS COMPANY

3. View of the male half of the connector with female terminals.

Fig. 198: View Of Female Half Of Connector With Male Terminals
Courtesy of GENERAL MOTORS COMPANY

4. View of the female half of the connector with male terminals.
5. Use the J-38125-215 tool to release the terminals by inserting the tool into the terminal release cavity.

Fig. 199: Using Removal Tool On Female Half Of Connector
Courtesy of GENERAL MOTORS COMPANY

6. View of the female half of the connector with male terminals.

Fig. 200: Using Removal Tool On Male Half Of Connector
Courtesy of GENERAL MOTORS COMPANY

7. View of the male half of the connector with female terminals.
8. While holding the removal tool in place, gently pull the wire out of the back of the connector. Always remember never use force when pulling a terminal out of a connector.
9. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#) procedure.
10. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

REPAIRING CONNECTOR TERMINALS (TERMINATED LEAD REPAIR)

Special Tools

EL-38125-10 Splice Sleeve Crimp Tool

For equivalent regional tools, refer to [Special Tools](#) .

NOTE: All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repairs procedures.

For high temperature wiring repairs, refer to [High Temperature Wiring Repairs](#).

Terminated leads are terminals that are crimped onto wires. The terminated lead can be used throughout the vehicle since it is designed for temperatures up to 150°C. The length of the wire is 450 mm.

1. Use the connector end view to identify the correct terminated lead.
2. The terminated lead package should include a DuraSeal splice sleeve. If not, use the chart to in Splicing Copper Wire Using Splice Sleeves to identify the correct DuraSeal splice sleeve, refer to [Wire to Wire Repair](#).

REPAIRING CONNECTOR TERMINALS (TERMINAL REPAIR)

Special Tools

- J-38125 - 580 Terminal Repair Kit
- J-38125-6 Crimp Tool
- J-38125-7 Crimp Tool
- J-38125-8 Crimp Tool
- J-38125-64 Crimp Tool
- J-38125-101 Crimp Tool
- J-38125-641 Crimp Tool
- J-38125-642 Crimp Tool
- J-38125-643 Crimp Tool

For equivalent regional tools, refer to [Special Tools](#).

Use the following repair procedures to repair each type of terminal:

- For push to seat terminals, refer to [Delphi Connectors \(Weather Pack\)Delphi Connectors \(Push To Seat\)Delphi Connectors \(Pull To Seat\)Delphi Connectors \(Micro-Pack 100W\)Delphi Connectors \(Micro.64\)Delphi Connectors \(12-Way\)Delphi Connectors \(Steering Gear\)](#).
- For pull to seat terminals, refer to [Delphi Connectors \(Weather Pack\)Delphi Connectors \(Push To Seat\)Delphi Connectors \(Pull To Seat\)Delphi Connectors \(Micro-Pack 100W\)Delphi Connectors \(Micro.64\)Delphi Connectors \(12-Way\)Delphi Connectors \(Steering Gear\)](#).

NOTE: The first step for all terminal repairs is to find the connector end view in SI.

Cable Seal Terminals

1. Cut off the terminal between the core and the insulation crimp to minimize any wire loss.
2. Remove the old seal.
3. Apply the correct cable seal, per the wire gauge size, from the kit. Slide the seal back along the wire to enable removal of the insulation.
4. To minimize wire loss, remove only the insulation required.
5. Using the connector end view, determine the correct crimp tool and crimp jaw.
6. Align the seal with the end of the cable insulation.
7. Position the stripped wire and seal in the terminal.
8. Hand Crimp the core wings first.

9. Hand Crimp the insulation wings around the seal and the cable.

Unsealed Terminals

1. Cut off the terminal between the core and the insulation crimp to minimize any wire loss.
2. To minimize wire loss, remove only the insulation required.
3. Position the stripped wire in the terminal.
4. Hand Crimp the core wings first.
5. Hand Crimp the insulation wings around the cable.

Micro-Pack 100W Size Terminal

The Micro-Pack 100W connectors have small terminals that are difficult to handle and hold when crimping. In order to aid the technician when crimping these terminals, a new crimping tool was developed. The J 38125-101 (W jaw) crimping tool was developed to crimp Micro-Pack 100W terminals. The J 38125-101 (W jaw) crimping tool has a terminal holding block that will hold the terminal in place while the terminal is being crimped. After the terminal is removed from the connector perform the following procedure in order to repair Micro-Pack 100 terminals.

1. Cut the wire as close to the terminal as possible.

NOTE: After cutting the damaged terminal from the wire, determine if the remaining wire is long enough to reach the connector without putting a strain on the wire. If the wire is not long enough, splice a small length of the same gauge wire to the existing wire, then crimp the new terminal on the added wire.

2. Strip 5 mm (3/16 in) of insulation from the wire.

Fig. 201: Identifying Crimping Tool Spring Loaded Locator

Courtesy of GENERAL MOTORS COMPANY

3. Depress the spring loaded locator of the J 38125-101 (W jaw) crimping tool until the terminal holder is completely visible.

Fig. 202: Locating Terminal In Crimping Tool
Courtesy of GENERAL MOTORS COMPANY

4. Insert the terminal into the crimp tool until the core wings are flush with the anvil on the crimp tool. Be sure that the wings are pointed toward the crimp tool former and release the spring locator. The locator will hold the terminal in place. Inspect the alignment of the terminal wings with the crimp tool former. If the terminal wings are wider than the crimp tool former, remove the terminal and bend the terminal wings in slightly.
5. Place stripped wire into terminal.
6. Crimp the new terminal to the wire. If a jam occurs, press the emergency release to open applicator.

Micro 0.64 Size Terminal

The Micro 64 connectors have small terminals that are difficult to handle and hold when crimping. In order to aid the technician when crimping these terminals, a new crimping tool was developed. The J 38125-64 (M jaw) was developed to crimp Micro 64 terminals. The J-38125-64 crimping tool has a terminal holding block that will hold the terminal in place while the terminal is being crimped. The J-38125-64 crimping tool is also designed to crimp both the wire and the insulation at the same time.

After the terminal is removed from the connector perform the following procedure in order to repair Micro 64 terminals.

NOTE: After cutting the damaged terminal from the wire, determine if the remaining wire is long enough to reach the connector without putting a strain on the wire. If the wire is not long enough, splice a small length of the same gauge wire to the existing wire, then crimp the new terminal on the added wire.

1. Cut the wire as close to the damaged terminal as possible.
2. Strip 5 mm (3/16 in) of insulation from the wire.

Fig. 203: Identifying Crimping Tool Spring Loaded Locator
Courtesy of GENERAL MOTORS COMPANY

3. Depress the spring loaded locator of the crimping tool until the terminal holder is completely visible.

Fig. 204: Identifying Terminal Holder

Courtesy of GENERAL MOTORS COMPANY

4. Insert terminal into the appropriate terminal holder until it hits bottom and stops. The correct terminal holder is determined by the wire size. Also ensure that the terminal's wings are pointing towards the former on the tool and the release locator.
5. Insert the stripped cable into the terminal. Insulation should be visible on both sides of the terminal insulation wings.
6. Compress the handles until the ratchet automatically releases.
7. Place the terminal into the appropriate cavity and assemble the connector.

TERMINAL REMOVAL

Special Tools

- **EL-38125-550** Terminal Release Tool Kit
- **EL-38125-580** Terminal Release Tool Kit
- **EL-35616** Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

NOTE: All repairs near the engine manifold, turbo engine and all exhaust pipes should follow the High Temperature Wiring Repair procedures.

1. Find the appropriate connector end view within the connector end view section. The connector end view has the following information:
 - Diagnostic probe tool
 - Terminal release tool
 - Terminal/terminated lead part numbers

NOTE: Not using the proper test kit probe may cause damage to the terminal(s) that are probed.

2. Determine if a terminal is damaged.
 1. Locate the diagnostic probe tool from the connector end view. The connector end view describes the color and part number to help the technician find and use the correct tool.
 2. Connect the probe tool to the Digital Multimeter.
 3. Insert the probe tool into the cavity and follow the procedures from the [Troubleshooting with a Digital Multimeter](#) .
3. Disconnect the connector body to perform the repair.
4. Use the following procedure to remove the terminal from the connector body.

NOTE: Several procedures for specific connector bodies are called out in the Wiring Repairs section.

1. The terminal position assurance (TPA) and connector position assurance (CPA) should be removed before releasing the terminal for the connector body.
2. Look at the connector end view to locate the cavity of the damaged terminal and find the proper terminal release tool from the terminal release tool kit.

NOTE: Using the incorrect terminal release tool can damage the connector body.

NOTE: Some terminals have a lever that must be disengaged before the terminal can be released.

3. Insert the terminal release tool into the cavity.

Fig. 205: Gently Pulling Wire Out Of Back Of Connector

Courtesy of GENERAL MOTORS COMPANY

5. Gently pull the wire out of the back of the connector.
6. Repair the terminal by following the [Repairing Connector Terminals \(Terminated Lead Repair\)](#)[Repairing Connector Terminals \(Terminal Repair\)](#) procedure.
7. Insert the repaired terminal back into the cavity. Repeat the diagnostic procedure to verify the repair and reconnect the connector bodies.

RELAY REPLACEMENT (ATTACHED TO WIRE HARNESS)

Removal Procedure

Fig. 206: Identifying Relay & Wire Harness Connector

Courtesy of GENERAL MOTORS COMPANY

1. Locate the relay. Refer to the [Master Electrical Component List](#) to locate the relay in the vehicle.
2. Remove any fasteners which hold the relay in place.
3. Remove any connector position assurance (CPA) devices or secondary locks.

NOTE: Use care when removing a relay in a wiring harness when the relay is secured by fasteners or tape.

4. Separate the relay (1) from the wire harness connector (2).

Installation Procedure

Fig. 207: Identifying Relay & Wire Harness Connector

Courtesy of GENERAL MOTORS COMPANY

1. Connect the relay (1) to the wire harness connector (2).
2. Install any connector position assurance (CPA) devices or secondary locks.
3. Install the relay using any fasteners or tape that originally held the relay in place.

RELAY REPLACEMENT (WITHIN AN ELECTRICAL CENTER)

Special Tools

EL-43244 Relay Puller Pliers

Removal Procedure

1. Remove the electrical center cover.

NOTE:

- Always note the orientation of the relay.
- If equipped with a notch style relay; observe the location of the notch on the old relay to verify the new relay is installed with the notch in the same location.

- Ensure that the electrical center is secure, as not to put added stress on the wires or terminals.

2. Locate the relay. Refer to [Electrical Center Identification Views](#) to locate the electrical center where the relay exists.

Fig. 208: Identifying Relay & Special Tool

Courtesy of GENERAL MOTORS COMPANY

3. Using the EL-43244 (1) position the tool on opposing corners of the relay (2).

CAUTION: Use EL-43244 to pull the relay straight out from the electrical center terminals. The use of pliers or a flat bladed tool could damage the electrical center.

4. Remove the relay (2) from the electrical center.

Installation Procedure

Fig. 209: Identifying Relay & Special Tool
Courtesy of GENERAL MOTORS COMPANY

1. Install the relay (2) in the same position as removed.
2. Install the electrical center cover.

GROUND REPAIR

Electrical Grounds

Proper electrical system function relies on secure, positive, corrosion-free ground connections. Loose, stripped, or corroded connections increase the possibility of improper system function and loss of module communication. These conditions may also lead to unnecessary repairs and component replacements.

In general, electrical ground connections are accomplished using one, or a combination of, three attachment methods:

- Welded M6 stud and nut
- Welded M6 nut and bolt
- Welded M8 nut and bolt

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

Determine which attachment method is used, and carry out the appropriate repair.

M6 Weld Stud Replacement

1. Select a location adjacent the damaged or missing M6 ground stud having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the M6 rivet stud flange.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.

3. Drill a 10 mm (0.40 in) diameter hole through the panel.
4. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

5. Select a replacement conductive M6 rivet stud. Reference the GM parts catalog for the correct part number and application.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the rivet stud threads.
11. Remove the painters tape or equivalent from the rivet stud threads.

12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. [Testing for Intermittent Conditions and Poor Connections](#)
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.
15. Install the ground terminal to the new rivet stud.
16. Select a new, conductive M6 nut. Reference the GM parts catalog for the correct part number and application.

CAUTION: [Fastener Caution](#)

17. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).
18. Check for proper system operation.

M6 Weld Nut

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the M6 weld nut at the electrical ground location is damaged or stripped, a new, conductive self-threading M7 bolt may be used to secure the ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the weld nut and allow to dry.
3. Remove any loose metal particles from the damaged or stripped weld nut with a stiff brush.
4. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive, self-threading M7 bolt threads.
5. Carefully remove any corrosion from the electrical ground terminal. [Testing for Intermittent Conditions and Poor Connections](#)
6. Install the electrical ground terminal to the new, conductive M7 bolt.

CAUTION: [Fastener Caution](#)

7. Install the conductive M7 bolt and tighten to 9 N.m (80 lb in).
8. Check for proper system operation.

M6 Weld Nut (Alternative Repair)

CAUTION: Use GM approved replacement fasteners with conductive finish for electrical ground repair.

1. If the electrical ground location is accessible from both sides of the panel, a conductive M6 bolt and a conductive M6 nut may be used to secure the electrical ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Select a location adjacent the damaged M6 weld nut having 20 mm (0.79) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding

the ground location and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M6 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Testing for Intermittent Conditions and Poor Connections
8. Install the electrical ground terminal and new, conductive M6 bolt to the ground location.

CAUTION: **Fastener Caution**

9. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).

NOTE: **The repair area must be properly refinished to maintain positive electrical grounding.**

10. Refinish the repair area using an anti-corrosion primer.
11. Check for proper system operation.

M8 Weld Nut

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. If the M8 weld nut electrical ground location is accessible from both sides of the panel, a conductive M8 bolt and a conductive M8 nut may be used to secure the ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Select a location adjacent to M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new electrical ground site.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the surface surrounding the ground location and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the new ground site until bare metal is visible.
6. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new, conductive M8 bolt threads.
7. Carefully remove any corrosion from the electrical ground terminal. Testing for Intermittent Conditions and Poor Connections
8. Install the electrical ground terminal and new, conductive M8 bolt to the ground location.

CAUTION: Fastener Caution

9. Install the conductive M8 nut and tighten to 22 N.m (16 lb ft).

NOTE: **The repair area must be properly refinished to maintain positive electrical grounding.**

10. Refinish the repair area using an anti-corrosion primer.

11. Check for proper system operation.

M8 Weld Nut (Alternative Repair)

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. If the M8 weld nut electrical ground location is not accessible from both sides of the panel, a conductive M6 rivet stud and a conductive M6 nut may be used to secure the ground terminal. Reference the GM parts catalog for the correct part number and application.
2. Select a location adjacent the damaged M8 weld nut having 20 mm (0.79 in) clearance behind the panel surface and 20 mm (0.79 in) clearance surrounding the new, conductive M6 rivet stud flange.
3. Using GM approved residue-free solvent or equivalent, remove any grease from the repair site and allow to dry.

NOTE: **Ensure 20 mm (0.79 in) clearance is maintained behind the panel to be drilled.**

4. Drill a 10 mm (0.40 in) diameter hole through the panel.
5. Carefully remove paint and primer from the area surrounding the rivet stud flange until bare metal is visible.
6. Using a rivet stud installer, install the replacement conductive M6 rivet stud.
7. Ensure the new rivet stud is securely fastened, with no detectable movement.

NOTE: **The rivet stud and surrounding panel area must be properly refinished prior to the installation of the ground terminal and nut to maintain positive electrical grounding.**

8. Completely wrap the threads of the rivet stud with painters tape or equivalent.
9. Refinish the repair area using an anti-corrosion primer.
10. Allow the refinished repair area to cure sufficiently before removing the protective material applied to the rivet stud threads.
11. Remove the painters tape or equivalent from the rivet stud threads.
12. Using GM approved residue-free solvent or equivalent, thoroughly clean the rivet stud threads to remove any adhesive and allow to dry.
13. Carefully remove any corrosion from the electrical ground wire terminal. Testing for Intermittent Conditions and Poor Connections
14. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the new conductive M6 rivet stud threads.

15. Install the ground terminal to the new, conductive M6 rivet stud.

CAUTION: Fastener Caution

16. Install the conductive M6 nut and tighten to 8 N.m (71 lb in).

17. Check for proper system operation.

Securing Loose Electrical Ground Connections

If the electrical ground connection is loose and the ground attachments are not damaged, properly securing the loose electrical ground may be all that is necessary. Carry out the following procedure to secure loose electrical ground connections.

CAUTION: **Use GM approved replacement fasteners with conductive finish for electrical ground repair.**

1. Using GM approved residue-free solvent or equivalent, thoroughly clean the ground stud threads and allow to dry.
2. Carefully remove any corrosion from the electrical ground wire terminal. Testing for Intermittent Conditions and Poor Connections
3. Using a small brush, apply Dielectric Lubricant GM P/N 12377900 (Canadian P/N 10953529) to the ground stud threads.
4. Install the ground wire terminal to the ground stud.

CAUTION: Fastener Caution

5. Install the appropriate conductive nut.
 - Conductive M6 nut: Tighten to 8 N.m (71 lb in)
 - Conductive M8 nut: Tighten to 22 N.m (16 lb ft)
 - Conductive M10 nut: Tighten to 45 N.m (33 lb ft)
6. Check for proper system operation.

FUSE BLOCK REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury

or death.

Preliminary Procedures

1. High Voltage Disabling .
2. Battery Negative Cable Disconnection and Connection
3. Rear Compartment Floor Stowage Trim Compartment Replacement

HOW TO USE ELECTRICAL SCHEMATICS

Information Overview

The following explains some of the key parts of the GM wiring diagrams. Included are:

- Color Abbreviations
- Electronic Delivery Navigation Features

Color Abbreviations

The following sequence is used when depicting wire colors:

1. Color modifier of the wire, such as light or dark (if applicable)
2. Primary color of the wire

3. Secondary color of the wire (tracer/stripe)

Wire insulation and connector body colors in schematic information are abbreviated with a two character code as listed below.

Abbreviation	Color	Abbreviation	Color
AM	Amber	OG	Orange
BARE	Bare	PK	Pink
BG	Beige	PU	Purple
BK	Black	RD	Red
BN	Brown	RU	Rust
BU	Blue	SR	Silver
CL	Clear	TL	Teal
CR	Cream	TN	Tan
CU	Curry	TQ	Turquoise
GD	Gold	VT	Violet
GN	Green	WH	White
GY	Gray	YE	Yellow
NA	Natural	-	-
Color Modifiers			
L	Light	D	Dark

Additionally, industry standard cable types are not identified by color, but are listed by cable type as follows:

Abbreviation	Cable Type
COAX	Coax Cable
ENET	Ethernet
FW	Flat Wire
HDMI	High Definition Multimedia Interface
LDVS	Low-voltage Differential Signaling
TWINAX	Twinax Cable
USB	Universal Serial Bus

Electronic Delivery Navigation Features

The schematics information has been enhanced for electronic delivery and the following explains the features that are now available.

The enhanced features are categorized into three types:

- Mouse-overs, which are active when the mouse pointer is placed over the activated area
- Hotspots (links to other information), which are active by placing the mouse pointer over the activated area and clicking the left mouse button
- Hotspot Target Highlighting, which is when linking from one graphic to another graphic, the point of interest will be highlighted in red. This feature is available only when linking from a schematic graphic to a component locator/harness routing view, or when linking from a schematic to an electrical center identification view

Depending on the amount of information that is linked to from a hotspot, the mouse pointer changes shape.

Fig. 30: Mouse Pointer Changes Shape

Courtesy of GENERAL MOTORS COMPANY

1. Basic mouse pointer - this means there are no hotspots available, but there may be a mouse-over available.
2. Single hand pointer - this means there is a mouse-over and hotspot link to a single document. Clicking on these areas will automatically take you to the target link.
3. Multiple hand pointer - this means there is a mouse-over and hotspot link to a multiple document. Clicking on these areas will bring up a pop-up menu that will display all available links. You may then select one of the available links clicking on one of the displayed links.

To see which areas of the schematic information have an available hotspot and/or a mouse-over, select and hold down the highlight hotspots button of the cgm viewer. This will highlight all areas of the graphic that have an available hotspot and/or a mouse-over in red. Once the button is released, the areas of the graphic will no longer be highlighted.

Fig. 31: Available Hotspot And/Or A Mouse-Over In Red
Courtesy of GENERAL MOTORS COMPANY

Each type of schematic related information has some level of these features. The schematic related information consists of the following information types:

- Schematics
- Connector End Views
- Component Locator Views
- Harness Routing Views
- Electrical Center Identification Views
- Master Electrical Component List
- Master Electrical Schematic Icons
- Schematics RPO Code List
- Circuit Number/Wire Colors
- Wire Lines
- Connector Cavities

Schematics

An electrical schematic hotspot is an activated icon or area in the schematic that can be cursor selected to link to additional information. Additionally, each of the hotspots in schematics has a mouse-over.

Hotspots in schematics are categorized into three types:

- Schematic Navigational Icon Hotspots
- Schematic Informational Icon Hotspots
- Schematic Navigational Hotspots

Schematic Navigational Icon Hotspots

The following lists icons that may appear on the upper right corner of a schematic that have an available mouse-over and hotspot.

Icon	Mouse-Over	Hotspot Link to Information
	Master Electrical Component List	Links to the vehicle Master Electrical Component List that shows all electrical components and harness items on the vehicle and has links to any available views
	Title of the subsystem description and operation	Links to the System Description and Operation

Icon	Mouse-Over	Hotspot Link to Information
	Control Module References	Links to the Control Module References table
	Title of the next schematic page	Links to the next schematic of the subsystem schematics

Icon	Mouse-Over	Hotspot Link to Information
	Title of the previous schematic page	Links to the previous schematic of the subsystem schematics

Schematic Informational Icon Hotspots

The following lists the icons that may appear anywhere on a schematic that have an available mouse-over and hotspot.

Icon	Mouse-Over	Hotspot Link to Information
 Danger	Master Electrical Schematic Icons	Links to the vehicle Master Electrical Schematic Icons list that describes the message for the icon.

Icon	Mouse-Over	Hotspot Link to Information
High Voltage 	Master Electrical Schematic Icons	Links to the vehicle Master Electrical Schematic Icons list that describes the message for the icon.
 Caution	Master Electrical Schematic Icons	Links to the vehicle Master Electrical Schematic Icons list that describes the message for the icon.
Supplemental Restraint	Master Electrical Schematic Icons	Links to the vehicle Master Electrical Schematic Icons list that describes the message for the icon.

Icon	Mouse-Over	Hotspot Link to Information
		
Pedestrian Impact 	Master Electrical Schematic Icons	Links to the vehicle Master Electrical Schematic Icons list that describes the message for the icon.
Additional Information	Master Electrical Schematic Icons	Links to the vehicle Master Electrical Schematic Icons list that describes the message for the icon.

Icon	Mouse-Over	Hotspot Link to Information
		

Schematic Navigational Hotspots

In addition to the navigational icons, schematics have other active hotspots that link to supporting information such as related schematics, component locator views, harness routing views, and connector end views.

These hotspots can be either text based or symbol based. The following are the items that will have a mouse-over and hotspot.

Schematic Title Circuit References

Fig. 32: Schematic Title Circuit References
 Courtesy of GENERAL MOTORS COMPANY

- 1. Mouse-over:** Displays the title of the schematic page linked to.
- 2. Hotspot Link to Information:** Links to the individual subsystem schematic page(s) that shows the circuit

in detail. If multiple circuits are included, or if the circuit is shown in multiple schematics, a menu will appear when the link is selected. This menu includes links to all schematics that contain the same circuit number as the circuit being referenced. Additionally, when the target schematic is opened, the referenced circuit will be highlighted to draw visual attention. Note that when there are multiple target links, the links may appear to be duplicate in the menu, however, they are not. The exact same title is repeated for each circuit number that is pointing to the same target schematic. A future update will include the circuit number before the link description to further assist in link selection.

Serial Data Functional Circuit Icon

Fig. 33: Serial Data Functional Circuit Icon
Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the schematic title Data Communication Schematics.
2. **Hotspot Link to Information:**
 - When a dashed serial data wire and icon are shown without any circuit numbers, the serial data circuit icon will link to the complete list of Data Communication schematic pages, and not a specific schematic. This is due to no circuit numbers are shown.
 - When a circuit wire(s) are shown with circuit numbers, a menu will appear when the link is selected. This menu includes links to the list of Data Communication schematic pages as well as links to the individual schematics that contain the same circuit number as the circuit being referenced. Additionally, when the target schematic is opened, the referenced circuit will be highlighted to draw visual attention. Note that when there are multiple target links, the links may appear to be duplicate in the menu, however, they are not. The exact same title is repeated for each circuit number that is pointing to the same target schematic. A future update will include the circuit number before the link description to further assist in link selection.

Fuse/Circuit Breaker Symbol and Name within Subsystem Schematics

Fig. 34: Fuse/Circuit Breaker Symbol And Name Within Subsystem Wiring Schematics
 Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code and the amperage of the protection device.
2. **Hotspot Link to Information:**
 - When multiple links are available, a menu will appear when the link is selected. This menu includes all available links in a structured sequence.
 1. Links to the individual schematic page(s) within the Power Distribution Schematics where the circuits are shown in detail. Additionally, when the target schematic is opened, the circuit protection device will be highlighted to draw visual attention.
 2. Links to individual fuse block top or bottom view(s) within the Electrical Center Identification Views and will show where the device is located in the fuse block. Additionally, when the target view is opened, the device outline will be highlighted for visual attention.

Ground Symbol/Name in Subsystem Schematics

Fig. 35: Ground Symbol/Name In Subsystem Wiring Schematics

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the ground number.

2. **Hotspot Link to Information:**

- When multiple links are available, a menu will appear when the link is selected. This menu includes all available links in a structured sequence.
 1. Links to the individual schematic page(s) within the Ground Distribution Schematics where the circuits are shown in detail. Additionally, when the target schematic is opened, the ground will be highlighted to draw visual attention.
 2. Links to the individual locator view(s) within the Ground Views and will show where the ground is located on the vehicle. Additionally, when the target view is opened, the ground and callout leader line/number will be highlighted to draw visual attention.

Body Control Module High-Side Driver Output Symbol/Driver Source Fuse Name in Subsystem Schematics

Fig. 36: Body Control Module High-Side Driver Output Symbol/Driver Source Fuse Name in Subsystem Wiring Schematics

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code of the protection device that supplies the high-side driver output circuit.
2. **Hotspot Link to Information:**
 - When multiple links are available, a menu will appear when the link is selected. This menu includes all available links in a structured sequence.
 1. Links to the individual schematic page(s) within the Power Distribution Schematics where the circuits are shown in detail. Additionally, when the target schematic is opened, the circuit protection device will be highlighted to draw visual attention.
 2. Links to individual fuse block top or bottom view(s) within the Electrical Center Identification Views and will show where the device is located in the fuse block. Additionally, when the target view is opened, the device outline will be highlighted for visual attention.

Component Name in Power and Ground Distribution Schematics

Fig. 38: Twisted Pair Symbols

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the repair specification for the number of twists of the wire within the specified distance.
2. **Hotspot Link to Information:** Links to the Master Electrical Schematic Icons list that shows the icon along with the repair specification details for the wire.

Relay Name (located within a block)

Fig. 39: Relay Name (located within a block)
 Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the relay code and name.
2. **Hotspot Link to Information:** Links to individual fuse block top or bottom view(s) within the Electrical Center Identification Views and will show where the device is located in the fuse block. Additionally, when the target view is opened, the device outline will be highlighted for visual attention.

Component Name in Subsystem Schematics

Fig. 40: Component Name In Subsystem Wiring Schematics
Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code and name of the component.

2. **Hotspot Link to Information:**

- When multiple links are available, a menu will appear when the link is selected. This menu includes all available links in a structured sequence.
1. Links to the individual locator view(s) within the applicable component view category and will show where the component is located on the vehicle. Additionally, when the target view is opened, the component and callout leader line/number will be highlighted to draw visual attention.
 2. Links to individual connector end view(s) within the Component Connector End Views.

Splice Names

Fig. 41: Splice Names

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code of the harness splice.
2. **Hotspot Link to Information:** Links to the individual harness routing view(s) within the Harness Routing Views and will show where the harness item is located on the vehicle harness. Additionally, when the target view is opened, the harness item and callout leader line/number will be highlighted to draw visual attention.

Splice Pack Names

Fig. 42: Splice Pack Names

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code of the harness splice pack.

2. **Hotspot Link to Information:**

- When multiple links are available, a menu will appear when the link is selected. This menu includes all available links in a structured sequence.

- Links to the individual harness routing view(s) within the Harness Routing Views and will show where the harness item is located on the vehicle harness. Additionally, when the target view is opened, the harness item and callout leader line/number will be highlighted to draw visual attention.
- Links to individual connector end view(s) within the Splice Pack Connector End Views.

Inline Harness Connector Names

Fig. 44: Regular Production Option (RPO) Codes/Icons
 Courtesy of GENERAL MOTORS COMPANY

- 1. Mouse-over:** Displays the description of the RPO code as well as the country group names where the option is possible to order. Note that each RPO shown will have its own mouse-over and description. Also note that the mouse-over does not include any symbols indicating with (shown as a + sign if combined option) or without (shown as a - sign to mean without/except).
- 2. Hotspot Link to Information:** Links to the Schematics RPO Code List that shows the RPO, the description of the option, and the country group names where the option is possible to order.

Circuit Number/Wire Colors

Fig. 45: Circuit Number/Wire Colors

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the circuit number (if shown) and the color abbreviation of the wire insulation. Refer to Color Abbreviations for an explanation of each wire color abbreviation. A future update may spell out the wire colors in all languages.
2. **Hotspot Link to Information:** None at this time.

Wire Lines

Fig. 46: Wire Lines

Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the circuit function of the wire as used on the vehicle. This same function is shown in the connector end view pinout table for the component the wire connects. Note if there is no circuit number shown, the circuit will not have an associated mouse-over.
2. **Hotspot Link to Information:** None at this time. A future update may include links to harness routing views to show the routing of the circuit within the vehicle harness.

Connector Identifiers and Cavities

Fig. 47: Connector Identifiers And Cavities
Courtesy of GENERAL MOTORS COMPANY

- 1. **Mouse-over:** Displays the cavity (pin) identifier (letter/number) for the connection at the component or inline harness connection.
- 2. **Hotspot Link to Information:** None at this time.

Connector End Views

Connector end view graphics now have mouse-overs to show the wire details of each of the populated cavities. Additionally, the terminal part information has been restructured into an easier to read table.

Fig. 48: Connector End View Graphics Table Information
Courtesy of GENERAL MOTORS COMPANY

- 1. **Mouse-over:** Displays all of the pinout table information for each column including Pin, Size, Color, Circuit, Function, Terminal Type ID, and Option. Note, that not used/not occupied cavities will not have a mouse-over at all. For not used/not occupied cavities, the connector graphic will appear to have a mouse-over, but no information will be displayed in a pop-up menu.
- 2. **Hotspot Link to Information:** None at this time. A future update may include links to individual subsystem schematic(s) for each circuit.

Component Locator Views

Component locator views now have links to component connector end views.

Fig. 49: Component Locator Views Have Links To Component Connector End Views
Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code and name of the component.
2. **Hotspot Link to Information:** Links to individual connector end view(s) within Component Connector End Views.

Harness Routing Views

Harness routing views now have links to splice pack and inline harness connector end views.

Fig. 50: Harness Routing Views Have Links To Splice Pack And Inline Harness Connector End Views
Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays the code of the harness item.
2. **Hotspot Link to Information:** Links to individual splice pack connector end view(s) within Splice Pack Connector End Views for splice packs and to the individual inline harness connector end view(s) within Inline Harness Connector End Views for inline harness connectors.

Electrical Center Identification Views

Electrical center identification views (top and bottom/front and back) graphics now have mouse-overs to show the function details of each of utilized devices. Note that the label view will not have any mouse-overs or links at all.

Fig. 51: Electrical Center Identification Views Graphics Have Mouse-Overs To Show Function Details
Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** Displays all of the usage table information for each column including No., Device Label Name, Device Assigned Name, Rating, and Description. Note, that not used/not occupied devices will not have a mouse-over at all. For not used/not occupied devices, the device graphic may appear to have a mouse-over, but no information will be displayed in a pop-up screen.
2. **Hotspot Link to Information:** None at this time.

Master Electrical Component List

While the master electrical component list format has not changed, it will continue to have links to component locator, harness routing, and connector end views for each of the available electrical devices within the vehicle.

Master Electrical Component List					
Master Electrical Component List					
Code	Name	Option	Location	Locator View	Connector End View
ASL	Sunshade - Left	—	In the passenger compartment, left front, mounted to the headliner at left front	—	—
ASR	Sunshade - Right	—	In the passenger compartment, right front, mounted to the headliner at right front	—	—
HA	Hybrid/IV Battery pack	H96	In the luggage compartment, right behind rear of the seats	Right Side of Luggage Compartment Components	—
A7	Fuel Pump and Level Sensor Assembly	—	In the vehicle underbody, below rear seats, mounted to fuel tank	Fuel Tank Components	A7 Fuel Pump and Level Sensor Assembly

ABR	Outside Rearview Mirror - Passenger	—	On outside of passenger door, front middle, forward of window opening	Passenger Door Components	—
A10	Inside Rearview Mirror	DOB	In the passenger compartment, front center, mounted to top of windshield	Headboard Components	A10 Inside Rearview Mirror (DOB)
A11	Radio	—	In the passenger compartment, front right in instrument panel, rear instrument panel modules being right	Rear of Instrument Panel Components	- A11 Radio X1 - A11 Radio X2 - A11 Radio X3 - A11 Radio X4 (DPR or DPR) - A11 Radio X2 (DPR) - A11 Radio X4 (DPR)
A14D	Seat Lumbar Support Pump - Driver	—	In the passenger compartment, left forward of center, in driver seat back outboard side	Driver Seat Components	A14D Seat Lumbar Support Pump - Driver
A14P	Seat Lumbar Support Pump - Passenger	ABH	In the passenger compartment, right forward of center, in the passenger seat back outboard side	Passenger Seat Components	A14P Seat Lumbar Support Pump - Passenger (ABH)
A15	Starter/Generator	H96	In the engine compartment, right front of engine	—	- A15 Starter/Generator X1 (DPR) - A15 Starter/Generator X2 (DPR)
A22	Radio Controls	—	In the passenger compartment, center front, part of the info display module, in instrument panel, above HVAC controls	Front of Instrument Panel Components	—
A23D	Door Latch Assembly - Driver	—	Inside the driver door, at rear below middle	Driver Door Components	A23D Door Latch Assembly - Driver
A23R	Door Latch Assembly - Left Rear	—	Inside the left rear door, at rear below middle	Left Rear Door Components	A23R Door Latch Assembly - Left Rear
A23P	Door Latch Assembly - Passenger	—	Inside the passenger door, at rear below middle	Passenger Door Components	A23P Door Latch Assembly - Passenger
A23RR	Door Latch Assembly - Right Rear	—	Inside the right rear door, at rear below middle	Right Rear Door Components	A23RR Door Latch Assembly - Right Rear
A24D	Door Handle Assembly - Driver Exterior	ATH	On the outside of driver door, rear middle	Driver Door Components	A24D Door Handle Assembly - Driver Exterior (ATH)
A24LR	Door Handle Assembly - Left Rear Exterior	ATH	On the outside of left rear door, rear middle	Left Rear Door Components	A24LR Door Handle Assembly - Left Rear Exterior (ATH)
A24P	Door Handle Assembly - Passenger Exterior	ATH	On the outside of passenger door, rear middle	Passenger Door Components	A24P Door Handle Assembly - Passenger Exterior (ATH)
A24RR	Door Handle Assembly - Right Rear Exterior	ATH	On the outside of right rear door, rear middle	Right Rear Door Components	A24RR Door Handle Assembly - Right Rear Exterior (ATH)
A26	HVAC Controls	—	In the passenger compartment, front center, on instrument panel, below radio controls	Front of Instrument Panel Components	A26 HVAC Controls
A28	Radio Dtn Waver	—	In the passenger compartment, front center, on instrument panel, below and forward of radio controls	—	A28 Radio Dtn Waver
B1	A/C Refrigerant Pressure Sensor	—	At the front of vehicle, right of center, front of A/C condenser, mounted to right side rear bottom	Radiator Assembly Components	- B1 A/C Refrigerant Pressure Sensor (DPR or DPR) - B1 A/C Refrigerant Pressure Sensor (DOB)
B5LF	Wheel Speed Sensor - Left Front	—	At the left front suspension, mounted to knuckle, rearward of axle	Fuel Conversion Sensor, Wheel Speed Sensors and Parkings Brake	B5LF Wheel Speed Sensor - Left Front
B5LR	Wheel Speed Sensor - Left Rear	—	At the left rear suspension, mounted to knuckle, forward side	Fuel Conversion Sensor, Wheel Speed Sensors and Parkings Brake	B5LR Wheel Speed Sensor - Left Rear
B5RF	Wheel Speed Sensor - Right Front	—	At the right front suspension, mounted to knuckle, rearward of axle	Fuel Conversion Sensor, Wheel Speed Sensors and Parkings Brake	B5RF Wheel Speed Sensor - Right Front
B5RR	Wheel Speed Sensor - Right Rear	—	At the right rear suspension, mounted to knuckle, forward side	Fuel Conversion Sensor, Wheel Speed Sensors and Parkings Brake	B5RR Wheel Speed Sensor - Right Rear
B7D	Air Temperature Sensor - Duct Left Lower	C12	In the passenger compartment, within the instrument panel, center front, left side middle of HVAC assembly	HVAC Assembly Components (C12)	B7D Air Temperature Sensor - Duct Left Lower (C12)
B7L	Air Temperature Sensor - Duct Right Lower	C12	In the passenger compartment, within the instrument panel, center front, right side middle of HVAC assembly	HVAC Assembly Components (C12)	B7L Air Temperature Sensor - Duct Right Lower (C12)
B7U	Air Temperature Sensor - Duct Left Upper	C12	In the passenger compartment, within the instrument panel, center front, left side top of HVAC assembly	HVAC Assembly Components (C12)	B7U Air Temperature Sensor - Duct Left Upper (C12)
B7I	Air Temperature Sensor - Duct Right Upper	C12	In the passenger compartment, within the instrument panel, center front, right side top of HVAC assembly	HVAC Assembly Components (C12)	B7I Air Temperature Sensor - Duct Right Upper (C12)
B8	Ambient Air Temperature Sensor	—	At the front of vehicle, left of center, mounted to rear of lower grille	Front of Vehicle Components	B8 Ambient Air Temperature Sensor
B10B	Ambient Light/Sunload Sensor	—	In the passenger compartment, center front, in instrument panel, rear of windshield defroster outlet	Front of Instrument Panel Components	B10B Ambient Light/Sunload Sensor
B12A	Transmission Fluid Pressure Switch	—	In the engine compartment, part of the control solenoid valve assembly, mounted to the valve body inside the transmission	—	—
B13	Transmission Fluid Temperature Sensor	—	In the engine compartment, part of the control solenoid valve assembly, mounted to the valve body inside the transmission	—	—

Fig. 52: Master Electrical Component List Format
Courtesy of GENERAL MOTORS COMPANY

1. **Mouse-over:** None at this time.

2. **Hotspot Link to Information:**

- A future update may include links to individual subsystem schematic(s) for each component/harness item.
- **Components**
- Links to individual locator view within one of the eight component view categories and will show where the component is located in the vehicle.
- Links to individual connector end view(s) within Component Connector End Views.
- **Electrical Centers (Fuse Blocks)**
- Links to individual locator view within one of the eight component view categories and will show where the component is located in the vehicle.
- Links to individual connector end view(s) within Electrical Center Identification Views.
- **Inline Harness Connectors**
- Links to individual harness routing view(s) within Harness Routing Views and will show where the harness item is located on the vehicle harness.

- Links to individual connector end view(s) within Inline Harness Connector End Views.
- **Grounds**
- Links to individual locator view within Ground Views component view and will show where the ground is located in the vehicle.
- **Splices**
- Links to individual harness routing view(s) within Harness Routing Views and will show where the harness item is located on the vehicle harness.
- **Splice Packs**
- Links to individual harness routing view(s) within Harness Routing Views and will show where the harness item is located on the vehicle harness.
- Links to individual connector end view(s) within Splice Pack Connector End Views.

Master Electrical Schematic Icons

While the master electrical schematic icons list format has not changed, it will continue to include icons used in the vehicle schematics along with the message for the icon.

Master Electrical Schematic Icons	
Icon	Icon Definition
	Warning: When performing service on or near the ESR components on the ESR wiring, the ESR system must be disabled. Refer to ESR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the ESR components, personal injury, or unnecessary ESR system repairs.
	Warning: When performing service on or near the pedestrian impact detection system (PIDS) components on the PIDS wiring, the PIDS must be disabled. Failure to observe the correct procedure could cause deployment of the PIDS components, serious injury can occur. Failure to observe the correct procedure could also result in unnecessary PIDS repairs.
	Warning: The high intensity discharge system produces high voltage and current. To reduce the risk of severe shocks and burns: • Never open the high intensity discharge system ballast or the air tube assembly starter. • Never probe between the high intensity discharge system ballast output connector and the air tube assembly. Warning: To help avoid personal injury, always test the accessory power receptacle, accessory DC/AC power inverter module, AC circuit wires, and connectors as if AC high-voltage is present. DANGER: Always perform the high voltage Disabling procedure prior to servicing any high voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The high voltage Disabling procedure will perform the following tasks: • Identify how to disable high voltage. • Identify how to test for the presence of high voltage. • Identify conditions under which high voltage is where present and personal protection equipment (PPE) and proper procedures must be followed. Failure to follow the procedures exactly as written may result in serious injury or death.
	Caution: The connector at the component cannot be disconnected or removed without damage to the component. If the connector is removed, the entire component with jumper harness must be replaced.
	Refer: Tinned wires provide an effective shield that helps protect sensitive electronic components from electrical interference. In order to prevent electrical interference from degrading the performance of the connected components, you must maintain the proper specification when making any repairs to the tested wires shown: • The wires must be tinned a minimum of 80µm per 23 cm (12 in) as measured anywhere along the length of the wires. • The outside diameter of the tested wires must not exceed 6.0 mm (0.25 in).

General Icons

Symbol	Description
--------	-------------

Symbol	Description
	Master Component List Icon This icon is used on the schematic to link to the Master Electrical Component List.

Symbol	Description
 A square icon with a thick black border. Inside the square, the letters 'D', 'E', 'S', and 'C' are arranged diagonally from the top-left to the bottom-right. The 'D' is at the top-left, 'E' is below and to the right of 'D', 'S' is below and to the right of 'E', and 'C' is at the bottom-right.	Description and Operation Icon This icon is used on the schematic to link to the Description and Operation of that particular system.

Symbol	Description
	Computer Programming Icon This icon is used on the schematic to link to Control Module References, which identifies which components need programming upon replacement.

Symbol	Description
	Next Schematic Page Icon This icon is used on the schematic to navigate to the next schematic in the subsystem.

Symbol	Description
	Previous Schematic Page Icon This icon is used on the schematic to navigate to the previous schematic in the subsystem.

Symbol	Description
 A black triangular warning icon containing a white silhouette of a person seated in a car seat, with a circular airbag inflating in front of them.	Supplemental Inflatable Restraint (SIR) or Supplemental Restraint System (SRS) Icon This icon is used to alert the technician that the system contains SIR/SRS components that require certain precautions before servicing.

Symbol	Description
	Information Icon This icon is used to alert the technician that there is additional information that will aid in servicing a system.

Symbol	Description
	Danger Icon This icon is intended to alert the technician that a component within the system contains labeling with the same icon. This icon is used when a source component has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Symbol	Description
	High Voltage Icon This icon is intended to alert the technician that a component within the system contains labeling with the same icon. This icon is used when a component/circuit has potential for 60 volts DC or greater or has potential for 42 volts AC or greater.

Symbol	Description
	Caution Icon This icon is used to advise the technician to use caution when servicing this component. This icon may be used when a component/circuit has a voltage range potential between 30-60 volts DC or 15-42 volts AC.

Symbol	Description
	Functional Serial Data Communication This icon is used to show the technician that the serial data circuit detail is shown incomplete. It also provides an active link to the Data Communication Schematics where the circuit is shown complete.

Symbol	Description
 The symbol depicts a vertical line representing a wire. A semi-circular bump is located on the left side of this line. An arrow points from the text 'Female Terminal' to the top of the bump, which is also labeled with the number '12'. Another arrow points from the text 'Male Terminal' to the bottom of the bump. The label 'X100' is positioned to the left of the bump.	Inline Harness Connector

Symbol	Description
 X100 12 Male Terminal Female Terminal	Inline Harness Connector

Symbol	Description
 The diagram shows a vertical line with a semi-circular arc at its base. Two 'X' marks are positioned on either side of the arc. Below the vertical line is a dashed rectangular box. The vertical line terminates at the top center of this dashed box.	Pigtail Connection

Symbol	Description
 The symbol depicts a pigtail connection. It features a dashed rectangular box at the top. A vertical line descends from the center of the bottom edge of this box, passing through a small solid black rectangle. Below this rectangle is a semi-circular arc, and a final vertical line extends downwards from the center of the arc. To the left of the semi-circular arc is the text 'X100', and to the right is the number '12'.	Pigtail Connection

Symbol	Description
	Provisional or Diagnostic Connector

Symbol	Description
	Blunt Cut Wire

Symbol	Description
	Incomplete Physical Splice

Symbol	Description
	Complete Physical Splice - 2 Wires

Symbol	Description
 The symbol consists of three horizontal lines representing wires. The top and bottom lines are connected at both ends by vertical lines, forming a rectangular frame. A third horizontal line is positioned between them. Two solid black dots are placed on the middle horizontal line, one at the center and one at the right end, indicating connection points for additional wires.	Complete Physical Splice - 3 or more wires

Symbol	Description
	Option Breakpoint

Symbol	Description
 The symbol consists of a central square with a thick border. A horizontal dashed line passes through the center of the square. A vertical dashed line extends downwards from the bottom center of the square.	Ground Circuit Connection

Symbol	Description
	Connector Shorting Clip

Component Parts

Symbol	Description
--------	-------------

Symbol	Description
	Partial Component When a component is represented in a dashed box, the component or its wiring is not shown in its entirety.

Symbol	Description
	Entire Component When a component is represented in a solid box the component or its wiring is shown in its entirety.

Symbol	Description
	Connector Directly Attached to Component

Symbol	Description
 The symbol for a Pigtail Connector consists of a vertical line at the top, followed by a semi-circular arc, then a small rectangular block, and another vertical line. To the right of the top vertical line is the number '12'. Below this assembly is a dashed rectangular box with L-shaped corner markers at each of the four corners.	Pigtail Connector

Switches and Relays

Symbol	Description
	Switch Actuator - Volume (Latching)

Symbol	Description
 The symbol is a schematic representation of a 4-pin single pole/throw relay in its normally open state. It is enclosed in a rectangular frame. On the left side, there are two vertical lines representing the input terminals. A diagonal line, representing the relay's contact, starts from the upper input terminal and extends towards the right. This line is dashed for most of its length and becomes solid as it enters a small rectangular box on the right side. This box represents the relay's coil, which is connected to two more vertical lines on the right side, representing the output terminals. The diagonal line is positioned such that the circuit is open.	4-Pin Single Pole/Throw Relay - Normally Open

Symbol	Description
 The diagram shows a 5-pin relay symbol. It consists of a large rectangle divided into three vertical sections. The leftmost section contains a horizontal line with a vertical step down on its left side. The middle section contains a diagonal line with an arrow pointing towards the right. The rightmost section contains a rectangle with a diagonal line from the bottom-left to the top-right. A dashed line connects the arrow in the middle section to the rectangle in the rightmost section.	5-Pin Relay - Normally Closed

Devices and Sensors

Symbol	Description
--------	-------------

Symbol	Description
	Battery

Symbol	Description
 The symbol for a Battery Assembly - Hybrid is a schematic representation of a battery pack. It consists of a central 3x2 grid of six individual cell symbols. Each cell is represented by a long vertical line (positive terminal) and a shorter horizontal line (negative terminal). The cells are connected in a series-parallel configuration. The entire grid is enclosed within a dashed rectangular border. Above the top-right corner of the dashed border is a '+' sign, and below the bottom-right corner is a '-' sign, indicating the overall polarity of the assembly.	Battery Assembly - Hybrid

Symbol	Description
	Single Filament Light Bulb

Symbol	Description
	Double Filament Light Bulb

Symbol	Description
	Light Emitting Diode (LED)

Symbol	Description
	Photo Sensor

Symbol	Description
	Gauge

Symbol	Description
	Diode

Symbol	Description
	Capacitor

Symbol	Description
 The image shows a standard electronic symbol for a resistor. It consists of a large rectangle with a smaller rectangle centered inside it. The smaller rectangle is oriented vertically, while the larger one is oriented horizontally. This symbol is used to represent a resistor in circuit diagrams.	Resistor

Symbol	Description
	Variable Resistor

Symbol	Description
 The symbol consists of a rectangular box. Inside the box, there is a resistor symbol (a rectangle with a diagonal line through it). To the right of the resistor symbol, there are two vertical arrows, one pointing up and one pointing down, indicating a variable resistance. The entire symbol is enclosed in a square frame.	Variable Resistor - NTC

Symbol	Description
	Breakable Wire

Symbol	Description
	Heating Element

Symbol	Description
 A schematic symbol for a position sensor. It consists of a large rectangle containing a smaller rectangle on the right side. A horizontal line extends from the left side of the smaller rectangle to the left edge of the large rectangle. An arrow points diagonally upwards and to the right, passing through the smaller rectangle.	Position Sensor

Symbol	Description
 The symbol for a pressure sensor is a rectangular box. Inside the box, on the left side, is a smaller square. This square is divided diagonally from the top-left corner to the bottom-right corner. The upper-left triangle of this square contains the letter 'P', and the lower-right triangle contains the letter 'U'. To the right of this square, a horizontal line extends from the middle of the square to the right edge of the main rectangular box. The top and bottom lines of the main rectangular box are continuous across the entire width of the symbol.	Pressure Sensor

Symbol	Description
 A schematic symbol for a knock sensor. It consists of a central rectangular block with a vertical line passing through its center. The line has a small horizontal bar at the top and bottom, resembling a T-junction. This entire assembly is enclosed within a square frame.	Knock Sensor

Symbol	Description
 The symbol consists of a gear icon on the left, representing an inductive sensor, and a rectangular box on the right. Inside the box is a vertical line with a small rectangle in the center, which contains a stylized '3' or 'I' shape, representing a 2-wire connection.	Inductive Type Sensor - 2-Wire

Symbol	Description
 The symbol consists of a gear icon on the left, representing a mechanical part. To its right is a rectangular box containing a smaller rectangle. Inside this smaller rectangle is a stylized '3' followed by a vertical line, indicating a 3-wire configuration. The entire assembly is enclosed within a larger rectangular frame with horizontal and vertical lines extending from the inner box, suggesting electrical connections.	Inductive Type Sensor - 3-Wire

Symbol	Description
	Hall Effect Sensor - 2-Wire

Symbol	Description
	Hall Effect Sensor - 3-Wire

Symbol	Description
 The symbol for a 2-wire oxygen sensor is enclosed in a square box. It features a diagonal line from the bottom-left to the top-right. On the left side of the diagonal line, there are two horizontal bars, one above the other, representing electrical terminals. On the right side of the diagonal line, there are also two horizontal bars, one above the other, representing electrical terminals.	Oxygen Sensor - 2-Wire

Symbol	Description
	Heated Oxygen Sensor - 4-Wire

Symbol	Description
 A schematic symbol for a solenoid actuator. It consists of a square frame divided into four quadrants by a vertical line. In the center, there is a smaller square containing a diagonal line from the bottom-left to the top-right. To the left of this central square, there is a small horizontal rectangle with a dot in its center, representing a solenoid coil.	Solenoid - Actuator

Symbol	Description
	Solenoid - Valve

Symbol	Description
 A hydraulic symbol for a clutch valve. It consists of a rectangular body divided into four quadrants by a vertical line. A diagonal line runs from the bottom-left to the top-right of the right half. To the left of the body is a horizontal line with a stepped, zig-zag profile.	Clutch

Symbol	Description
	Motor

Symbol	Description
 The symbol is enclosed in a rectangular frame. At the top is a circle containing the letter 'M'. Below the circle is a rectangular component with a diagonal line through it, representing a PTC. At the bottom of the frame are two upward-pointing arrows.	Motor with PTC

Symbol	Description
	Antenna

Symbol	Description
 A black outline symbol of a speaker, consisting of a trapezoidal shape with a smaller rectangle inside, representing a sound source.	Speaker

Symbol	Description
	Horn

Symbol	Description
 A black and white line drawing of a microphone. It features a circular head with a small circle in the center, mounted on a rectangular base. The entire microphone is enclosed within a square frame that has a horizontal bar across the top, resembling a stand or a mounting bracket.	Microphone

Symbol	Description
	Airbag

Symbol	Description
	SIR Coil

Symbol	Description
	SIR Impact Sensor

VEHICLE ZONING STRATEGY

All grounds, in-line connectors, and splices have identifying numbers that correspond to where they are located in the vehicle. The following table explains the numbering system.

Fig. 55: Passenger Car Zoning View

Courtesy of GENERAL MOTORS COMPANY

Callout Numbers	Zone Description
100-199	Engine compartment (all forward of the instrument panel)
200-299	Within the instrument panel area (between the bulkhead and the front plane of the instrument panel)
300-399	Passenger compartment (from instrument panel to the back of the rear seats)
400-499	Luggage compartment (from the back of the rear seats to the rear of the vehicle)
500-599	Inline harness connectors to or within the driver door
600-699	Inline harness connectors to or within the front passenger door
700-799	Inline harness connectors to or within the left rear door
800-899	Inline harness connectors to or within the right rear door
900-999	Inline harness connectors to or within the luggage compartment lid or hatch

SCHEMATICS RPO CODE LIST

MASTER ELECTRICAL SCHEMATIC ICONS

Icon	Icon Definition
-------------	------------------------

Icon	Icon Definition
	WARNING: When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.

Icon	Icon Definition
	WARNING: The high intensity discharge system produces high voltage and current. To reduce the risk of severe shocks and burns: • Never open the high intensity discharge system ballast or the arc tube assembly starter. • Never probe between the high intensity discharge system ballast output connector and the arc tube assembly. WARNING: To help avoid personal injury, always treat the accessory power

Icon	Icon Definition
	receptacle, accessory DC/AC power inverter module, AC circuit wires, and connectors as if AC high-voltage is present. WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure will perform the following tasks: • Identify how to disable high voltage. • Identify how to test for the presence of high voltage.

Icon	Icon Definition
	Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Failure to follow the procedures exactly as written may result in serious injury or death.
	WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed. The High Voltage Disabling procedure includes the following steps: - Identify how to disable high voltage. - Identify how to test for the presence of high voltage. - Identify

Icon	Icon Definition
	condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed. Before working on any high voltage system, be sure to wear the following Personal Protection Equipment: • Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors. • Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors. • Visually and functionally inspect the gloves before use. • Wear the Insulation gloves with leather protectors at all times when working with the

Icon	Icon Definition
	high voltage battery assembly, whether the system is energized or not. Failure to follow the procedures may result in serious injury or death.
	NOTE: Twisted wires provide an effective shield that helps protect sensitive electronic components from electrical interference. In order to prevent electrical interference from degrading the performance of the connected components, you must maintain the proper specification when making any repairs to the twisted wires shown : • The wires must be twisted a minimum of 16

Icon	Icon Definition
	turns per 31 cm (12 in) as measured anywhere along the length of the wires. • The outside diameter of the twisted wires must not exceed 6.0 mm (0.25 in).

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V or greater than 18 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the 12 V charging system.
- A possible cause of this DTC could be overcharging with a 12 V battery charger or jump starting.

Circuit/System Verification

1. Ignition OFF, disconnect the drive motor battery charger cable from the X98 Hybrid/EV Battery Charger Receptacle. Measure and record the battery voltage at the battery terminals.
2. Verify the battery voltage stabilizes between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
 - **If battery voltage is less than 12.4 V or more than 12.8 V**

Refer to Battery Inspection/Test.

- **If battery voltage is between 12.4 and 12.8 V**
3. Engine running, headlights ON, measure and record the battery voltage at the battery terminals.
 4. Verify the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.
 - **If the voltage is not at least 1 V greater than the voltage measured in step 1 or is greater than 15 V.**

Refer to DC Power Conversion Test .

- **If the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.**
5. Verify the appropriate control module battery voltage and ignition voltage parameters are available in the scan tool.
 - **If parameters are not available in the scan tool**

Refer to Circuit/System Testing

- **If parameters are available in the scan tool**

6. Verify the appropriate control module scan tool battery voltage and ignition voltage parameters are within 1 V of the battery voltage.

- **If not within 1 V of the battery voltage**

Refer to Circuit/System Testing

- **If within 1 V of the battery voltage**

7. All OK.

Circuit/System Testing

NOTE: Use the schematic to identify the following:

- **Control modules the vehicle is equipped with**
- **The control module's ground, B+, and Ignition circuit terminal IDs and connectors**

NOTE: Some control module ground circuits may require up to 20 min after the ignition is turned off before achieving a resistance reading of less than 10 Ω . In most cases the readings will drop below 20 Ω within 1 min indicating the control module is going to sleep.

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between each ground circuit terminal and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the appropriate control module.

- **If the test lamp illuminates**

4. Ignition ON.

5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the appropriate control module.

- **If the test lamp illuminates**

6. Replace the control module.

Repair Instructions

Low Reference	-	B1516 08	-	-

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The body control module (BCM) supplies 5 V and ground to the battery current sensor. The battery current sensor measures the amount of current flowing to or from the battery, and supplies a pulse width modulation (PWM) signal to the BCM.

Conditions for Running the DTC

B1516 08

The BCM is awake.

B1516 66

- The BCM is awake.
- The engine is OFF.

Conditions for Setting the DTC

B1516 08

The battery current signal is less than 4 percent or greater than 96 percent duty cycle for 2 minutes.

B1516 66

The battery current polarity is positive for 2 minutes.

Action Taken When the DTC Sets

The regulated voltage control (RVC) is disabled.

Conditions for Clearing the DTC

The DTC passes when the battery current returns to the normal range for 15 seconds.

Diagnostic Aids

DTC B1516 08 could be set by overcharging with a battery charger or jump starting.

B1516 08

1. Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at the B18 Battery Current Sensor.
It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal 2 and ground.
 - **If 30 Ω or greater**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If less than 30 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If between 4.8 - 5.2 V**
5. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

• **If greater than 5.2 V**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

• **If between 4.8 - 5.2 V**

6. Test or replace the B18 Battery Current Sensor.

B1516 66

1. Verify that the B18 Battery Current Sensor is installed securely around the negative battery cable, with the tape tab pointing away from the negative terminal on the C1 Battery.

• **If the B18 Battery Current sensor is not installed correctly**

Remove and reinstall the B18 Battery Current Sensor properly.

• **If the B18 Battery Current Sensor is installed correctly**

2. Replace the B18 Battery Current Sensor.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B151A 58

Low Battery Capacity Detected

Circuit/System Description

The body control module (BCM) monitors the battery voltage level during an engine crank event to detect a low battery voltage condition.

Conditions for Running the DTC

The vehicle is ON

Conditions for Setting the DTC

A minimum crank battery voltage is less than the minimum crank battery voltage threshold for 16 consecutive crank events.

Action Taken When the DTC Sets

A driver information center message is displayed.

Conditions for Clearing the DTC

The DTC will clear if the minimum crank voltage is greater than the minimum crank voltage threshold during a crank event.

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527 00

Parasitic Load

Circuit/System Description

The body control module (BCM) monitors the state of charge of the electrical system.

Conditions for Running the DTC

The ignition is in Accessory or Run mode.

Conditions for Setting the DTC

The state of charge at ignition ON is 30% lower than when the engine was running and battery drain is more than 2 A.

Action Taken When the DTC Sets

There is no battery telltale illuminated or DIC message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.
- The DTC will clear when run state of charge is greater than or equal to 80%.

DTC P0A8D: 14V POWER MODULE SYSTEM VOLTAGE LOW VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0A8D

14V Power Module System Voltage Low Voltage

Circuit/System Description

The 14V power module, often referred to as the accessory DC power control module, converts the high voltage (360V) direct current (DC) to low voltage (14V) DC to charge the 12V battery and to operate the power accessories. The ECM controls the 14V power module by supplying a 5V pulse width modulated (PWM) signal through a control circuit. The ECM monitors 12V battery voltage to ensure the 14V power module is maintaining the desired voltage.

Conditions for Running the DTC

14V power module is commanded ON.

Conditions for Setting the DTC

The ECM monitored battery voltage is less than or equal to 11V for 8 s within a 10 s window.

Action Taken When the DTC Sets

- The charge indicator is illuminated.
- The 14V power module stops supplying power to the 12V system.
- DTC P0A8D is a Type C DTC.

Conditions for Clearing the DTC

DTC P0A8D is a Type C DTC.

Diagnostic Aids

An improperly fastened 200-amp in-line mega-fuse may cause this DTC to set.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Testing

1. Verify DTC P1F59, P1F5A, P1F5B, P1F5D, or P1F5E is not set.

- **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- If the DTC is not set

2. Perform the DC Power Conversion Test .

DTC P1F5D OR P1F5E: 14 VOLT POWER MODULE L-TERMINAL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P1F5D

14 Volt Power Module L-Terminal Circuit Low Voltage

DTC P1F5E

14 Volt Power Module L-Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - L Terminal	P1F5D	-	P1F5E	-

Circuit/System Description

The ECM uses two circuits to control and monitor the state of the 14V power module, often referred to as the accessory DC power control module. The control circuit functions much like the L Terminal circuit on a generator equipped vehicle. A high side driver in the ECM applies a duty cycled voltage to the 14V power module. The duty cycle controls the 14V power module output. The ECM monitors the state of the 14V power module control circuit. The ECM will detect faults on the 14V power module control circuit when the vehicle is ON.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

- P1F5D: The ECM detects a low voltage on the 14V power module control circuit for 8 seconds out of a 10 second window.
- P1F5E: The ECM detects a high voltage on the 14V power module control circuit for 8 seconds out of a 10 second window.

Action Taken When the DTC Sets

DTCs P1F5D and P1F5E are type C DTCs.

Conditions for Clearing the DTC

DTCs P1F5D and P1F5E are type C DTCs.

Circuit/System Verification

NOTE: Do not have a 12V battery charger connected during the testing.

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K1 14V Power Module, Vehicle On
2. Test for 3.0 - 5.5 V between the signal circuit terminal 1 X1 and ground.

- **If less than 3.0 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If greater the 2 Ω , repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.5 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit 1 X1 and ground.

- If greater than 1 V, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 3.0 - 5.5 V**

3. Test or replace the K1 14V Power Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P1F59, P1F5A, OR P1F5B: 14 VOLT POWER MODULE STATUS TERMINAL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1F59

14 Volt Power Module Status Terminal Circuit Performance

DTC P1F5A

14 Volt Power Module Status Terminal Circuit Low Voltage

DTC P1F5B

14 Volt Power Module Status Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - L Terminal	P1F5D	-	P1F5E	-
Status - F Terminal	P1F59, P1F5A	P1F59, P1F5A	P1F59, P1F5B	P1F59

Circuit/System Description

The ECM uses two circuits to control and monitor the state of the 14V power module, often referred to as the accessory DC power control module.

The status circuit functions much like the F Terminal circuit on a generator equipped vehicle. A high side driver in the 14V power module applies a duty cycled voltage to the ECM. The duty cycle indicates 14V power module internal temperature and operational condition. The ECM will detect faults on the 14V power module status circuit when the vehicle is ON.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

- P1F5A: The ECM detects a 5% or lower PWM signal on the 14V power module status circuit for 8 seconds out of a 10 second window.
- P1F5B: The ECM detects a 96% or higher PWM signal on the 14V power module status circuit for 8 seconds out of a 10 second window.
- P1F59: The status circuit PWM signal is not in a valid range.

Action Taken When the DTC Sets

DTCs P1F59, P1F5A and P1F5B are type C DTCs.

Conditions for Clearing the DTC

DTCs P1F59, P1F5A and P1F5B are type C DTCs.

[Circuit/System Verification](#)

1. Vehicle OFF. Connect the vehicle to an AC supply to begin charging
2. Vehicle in Service Mode
3. Verify that DTC P0D26 is not set and that the vehicle will charge
 - **If the DTC is set or the vehicle will not charge**

Refer to DTC P0D26

- **If the DTC is not set**

NOTE: Do not have a 12V battery charger connected during the testing.

- 4.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**
Refer to Circuit/System Testing, specific to the DTC(s) set
 - **If the DTC does not set**
7. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

- 1.

DTC P1F5A or P1F5B, without P1F59 Diagnosis

1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module, Vehicle On
2. Test for 4.6 V - 7.0 V between the signal circuit terminal 19 X3 and ground.
 - **If less than 4.6 V**
 1. Vehicle OFF, disconnect the harness connector at the K1 14V Power Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If greater the 2 Ω , repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K1 14V Power Module.
 - **If greater than 7.0 V**
 1. Vehicle OFF, disconnect the harness connector at the K1 14V Power Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit 19 X3 and ground.
 - If greater than 1 V, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K1 14V Power Module..
 - **If between 4.6 V - 7.0 V**
 3. Test or replace the K20 Engine Control Module.

DTC P1F59 Diagnosis

NOTE: You must perform Circuit/System Verification first

1. Disable the high voltage system for servicing the T18 Battery Charger, K1 14V Power Module and the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling
2. Disconnect the X3 connector at the T18 Battery Charger, the X4 connector at the K1 14V Power Module and the X6 connector at the A28 Hybrid/EV Battery Contactor Assembly
3. Verify that all HV harness connector and the mating module connector terminals are free from moisture, corrosion, and arc flash damage.

- **If any terminals show signs of damage**

Replace the HV wiring harness and affected modules as necessary

- **If no arc flash damage, moisture, or corrosion is found**

4. Test the following HV harness terminals for less than 2 Ω end to end:

- X6-1 to X4-B
- X6-1 to X3-1
- X6-2 to X4-A
- X6-2 to X3-2

- **If greater than 2 Ω**

Replace the HV wiring harness

- **If less than 2 Ω**

Replace the K1 14V Power Module

5. Enable high voltage. Refer to High Voltage Enabling
6. Verify the DTC does not set

- **If the DTC sets**

Replace the K20 Engine Control Module

- If the DTC does not set

7. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Charger Receptacle, Accessory DC Power Control Module, and Drive Motor Battery Charger

Control Module Supply Circuit High Voltage

DTC U350B

Control Module Input Power "C" Circuit Intermittent/Erratic

Circuit/System Description

The vehicle control module monitors the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 7.5 V or greater than 16 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the 12 V charging system.
- A possible cause of this DTC could be overcharging with a 12 V battery charger or jump starting.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle OFF, disconnect the drive motor battery charger cable from the X98 Hybrid/EV Battery Charger Receptacle. Measure and record the 12 V battery voltage at the battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the Vehicle OFF.
 - **If battery voltage is not between 12.4 and 12.8 V**
Refer to [Battery Inspection/Test](#).
 - **If battery voltage is between 12.4 and 12.8 V**
2. Vehicle ON, accessories OFF, measure and record the battery voltage at the battery terminals.
3. Verify the voltage is at least 1 V greater than the minimum voltage measured in step 1, but less than 15 V.
 - **If the voltage is not at least 1 V greater than the minimum voltage measured in step 1 or is greater than 15 V.**
Refer to [DC Power Conversion Test](#).
 - **If the voltage is at least 1 V greater than the minimum voltage measured in step 1, but less than 15 V.**
4. Verify the appropriate control module scan tool battery voltage and ignition voltage parameters are within 1 V of the battery voltage.
 - **If not within 1 V of the battery voltage**
Refer to Circuit/System Testing.
 - **If within 1 V of the battery voltage**
5. All OK.

Circuit/System Testing

NOTE: Use the schematic to identify the following:

- **Which control modules the vehicle is equipped with**
 - **The control modules ground, B+, and Ignition circuit terminal IDs and connectors**
1. Vehicle OFF, and all vehicle systems off, disconnect the scantool and harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.
 2. Test for less than 10 Ω between each ground circuit terminal and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
 3. Verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate control module.
- **If the test lamp illuminates**

4. Vehicle ON.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , refer to [Power Mode Mismatch](#).

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate control module.

- **If the test lamp illuminates**

6. Replace the appropriate control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for control module replacement, programming and setup.

SYMPTOMS - ENGINE ELECTRICAL

The following steps must be completed before using the symptom tables.

- Perform [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - The power modes are correct.
 - The control modules can communicate via the serial data link.
 - There are no DTCs set.
- Review the system descriptions and operations in order to familiarize yourself with the system functions. Refer to one of the following system operations:
 - [Battery Description and Operation](#)
 - [Charging System Description and Operation](#)

- **Starting System Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the 12 V charging system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Battery Inspection/Test**
- **Battery Charging**
- **Battery Electrical Drain/Parasitic Load Test**
- **Charging System Test**

BATTERY INSPECTION/TEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

NOTE: For Warranty repairs -

You must use regionally required battery test equipment for warranty repairs.

For accurate test results the battery must be disconnected from the vehicle and the equipment connected directly to the battery posts. When setting up the equipment, select "Out of Vehicle" and then the correct battery type (Flooded, AGM or Stop/Start AGM) and rated CCA (both from the battery label) must be entered.

- **Failure to obtain the correct connections during the test may result in a failed test on a good battery.**
- **Use the Out of Vehicle test (battery disconnected with test equipment connected directly to the posts) for each battery when testing a vehicle with dual batteries.**

Special Tools

EL 50313 Battery Tester For equivalent regional tools, refer to [Special Tools](#)

Circuit/System Testing

WARNING: Unless directed otherwise, the ignition must be OFF with the key removed, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

1. Verify the C1 Battery or C1B Battery - Auxiliary (if equipped) case is not cracked, broken, or damaged, which may be indicated by battery acid leakage.
 - If there is any apparent damage

Replace the C1 Battery or C1B Battery - Auxiliary.

- **If there is no damage**

2. Verify that the battery cables are clean and tight. The battery terminal bolts should be torqued as specified in [Fastener Specifications](#).

- **If the battery cables need to be cleaned or tightened**

Clean as required and tighten as specified.

- **If the battery cables are clean and tight**

3. Disconnect battery from the vehicle. There is no need to remove the battery from the vehicle.
4. Connect the EL-50313 directly to the battery terminal posts.
5. Select "Charging," "Diagnostic" and "Out of Vehicle" when setting up the test.
6. Select the proper battery type, Flooded, AGM or Stop/Start AGM.
7. Enter the CCA as shown on the battery label.
8. Verify the test result is not REPLACE BATTERY or BAD CELL-REPLACE

NOTE: Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the Out of Vehicle test.

- **If the test result is REPLACE BATTERY or BAD CELL-REPLACE**

Replace the C1 Battery or C1B Battery - Auxiliary.

- **If the test result is not REPLACE BATTERY or BAD CELL-REPLACE**

9. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Battery Replacement

BATTERY CHARGING

12 V Battery

The following procedure is for the 12 V battery only.

Special Tools

EL 50313 Midtronics GR8 Battery Tester Charger

For equivalent regional tools, refer to [Special Tools](#).

Diagnostic Aids

NOTE: This vehicle is equipped with an Absorbent Glass Matt Battery. This type of battery

requires different charging and testing parameters than the more common regular flooded lead acid type battery. ANY time you perform charging and or testing you MUST set up the charging/testing equipment or permanent damage to the battery may result.

- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the EL 50313 before charging.
- An AGM battery may be damaged if charged to more than 14.5 V.
- A Flooded Cell battery may be damaged if charged to more than 16.5 V.
- Vehicles with dual batteries must be charged individually which will result in two printouts.

Battery State of Charge

NOTE: Using voltage to determine the battery's state of charge is only accurate after the battery has been at rest for 24 hours. This is enough time for the acid in each cell to equalize. If the battery has been charged or discharged in the past 24 hours, the battery state of charge will only be an estimate.

The maintenance-free batteries state of charge is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the battery's state of charge:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 hours.
 - If the answer is no, the terminal voltage will be stabilized and no action is necessary before reading the voltage. Skip to step 3.
 - If the answer is yes, terminal voltage will not be stabilized and you should wait 12 hours since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been exposed for the past 12 hours.

NOTE: The table is accurate to 10 percent only after the battery has been at rest for 12 hours.

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the state of charge according to the estimated battery temperature:

Battery Voltage	% Charge at 0Â°C (32Â°F)	% Charge at 25Â°C (75Â°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%
12.2 V	65%	45%
12.0 V	40%	20%

Use the state of charge information as follows:

- A battery with a state of charge that is below 65 percent must always be recharged before returning it to service or continuing storage.
- A battery with a state of charge that is 65 percent or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90 percent, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity - The higher the charger amperage, the less time it will take to charge the battery.
- The state of charge of the battery - A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 V, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturer's instructions for operating this circuitry.
- The temperature of the battery - The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

CAUTION: Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jumper cables. Failure to do so may damage the ECM/PCM or other electronic components.

CAUTION: Refer to [Fastener Caution](#) .

When charging side-terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When charging side-terminal batteries with the battery cables disconnected, install the battery side terminal adapters and connect the charger to the adapters.

Use the following procedure to charge the battery:

1. Ensure that all of the battery terminal connections are clean and tight.
2. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud underhood.

CAUTION: Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.

3. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
4. Select "Charging," "PDI" and "In Vehicle" when setting up the charger.

5. Select the proper battery type, Flooded, AGM, Spiral AGM or Stop/Start AGM.
6. Enter the CCA as shown on the battery label.

BATTERY ELECTRICAL DRAIN/PARASITIC LOAD TEST

12 V Battery

The following procedure is for the 12 V battery only.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

Components most likely to cause a parasitic draw on the vehicle's battery are switches, relays, and control modules. After the vehicle is turned OFF the control modules will begin to go to sleep (shut OFF). All control modules do not go to sleep at the same time, some may take up to 30 minutes or longer after turning the Vehicle OFF before going to sleep, like the HVAC and body control modules. Others such as the telematics communication interface control module and remote control door lock receiver may periodically wake up then go back to sleep. These are all normal conditions.

Diagnostic Aids

- Rule out any possible aftermarket equipment causing an unacceptable parasitic current drain. Aftermarket accessories installed into the courtesy lamp circuit can cause the inadvertent power timer in the body control module (BCM) to keep resetting. This would cause the BCM to remain awake and cause a current drain on the battery.
- Rule out customer driving habits such as regular short trips that do not allow enough time to properly charge the battery. Refer to [Battery Description and Operation](#).
- Verify that the battery and charging system are in proper working order. Refer to [Battery Charging](#), and [Charging System Test](#).
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a dome light or stuck relay.
- Some systems and modules such as OnStar[®], and regulated voltage control, if equipped, are designed to wake-up, perform a task, and go back asleep at regular intervals. Refer to [Body Control System Description and Operation](#) for the system or modules description and operation.
- An engine off natural vacuum evaporative test can occur if the engine control module (ECM) determines the drive cycle has met the appropriate criteria immediately after key off. The ECM will stay awake and the vent solenoid will stay energized for as long as 45 minutes. The typical current draw for this is about 1 A.
- The telematics communication interface control module current draw is very low, less than 40 mA, so the OnStar system is left in that "awake" state for up to the first 48 hours. Parasitic draw of up to 40 mA with an occasional spike as high as 80 mA through the telematics communication interface control module for the first 48 hours is normal.
- Some automatic climate control systems can remain in a semi-awake state for up to three hours, actual draw amounts vary by vehicle platform but are typically not greater than 50 mA.
- An extremely low mA current level is consumed by the RKE receiver for monitoring purposes, actual system wake up only occurs when the fobs for the vehicle are used. When other devices on the same RKE operating

frequency are activated, such as the 4 tire pressure monitoring sensors and other vehicle transmitters in the vicinity, the RKE receiver will have a 100 mA spike. These spikes are normal and occur too briefly to have a significant effect on battery drain. Competing signals may cause RKE performance issues such as jamming but should not cause excessive battery draw.

- If an excessive current draw is not present during initial testing, continue periodic testing over a 1-2 hour period to see if the current draw increases and stays above an unacceptable level.

NOTE: The battery specification listed below is a generic specification. Refer to the label on the original battery when testing the battery.

- The battery run down time will vary depending on the batteries reserve capacity. If the reserve capacity is higher, then the battery run down time would be longer. If the reserve capacity is lower, then the battery run down time would be shorter. The graph below indicates roughly how many days a 690 cold cranking amp battery with a 110 minute reserve capacity starting at 80 percent state of charge will last with a constant current draw until it reaches 50 percent state of charge. Differences in battery reserve capacity and temperature will affect the results.

Current Drain	Days
25 mA	33
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

Special Tools

EL 38758 Parasitic Draw Test Switch

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

NOTE:

- Most vehicle systems will go to sleep within 30 minutes but it can take up to 2 hours before all systems power down allowing the parasitic draw test to pass. An occasional increase in the parasitic draw is normal as long as it returns within 1 second.
- Closing the door latches/ajar switch while leaving the doors open is recommended, this allows the vehicle systems to perform in a "doors closed" mode while allowing vehicle interior access that may be needed to complete the diagnostic steps.
- Locking doors will arm the vehicle content theft deterrent system if equipped. Failure to arm the system may cause a theft system fault to not be present during testing.
- There are many things that can prevent the vehicle from completely going to sleep and passing the parasitic draw test. Make sure all the conditions listed below are met before performing the parasitic current draw test.
 - Vehicle OFF
 - Retained Accessory Power RAP OFF - open and close the driver door after Vehicle OFF
 - Scan tool not communicating with a vehicle control module - in some cases it may need to be disconnected from the data link connector.
 - All access doors closed
 - Headlamps OFF - auto headlamps disabled
 - Any delay lighting OFF
 - If equipped with an under hood lamp disable it
 - HVAC after blow OFF
 - Any accessory that can work with Vehicle OFF inactive or OFF
 - Wait up to 2 minutes or longer, after all other listed conditions are met

Using an Inductive Pickup Probe

1. Connect an inductive pickup probe to the negative battery cable that can read down to 1 mA.
2. Vehicle OFF, as the vehicle systems shut down test for less than 30 mA of parasitic current drain.
 - If greater than the specified range, refer to Circuit/System Testing.

Using the EL 38758 Parasitic Draw Test Switch

WARNING: Refer to [Battery Disconnect Warning](#) .

CAUTION: When a fused jumper wire or digital multimeter is connected to the test switch terminals, always turn the test switch ON before opening any access door, turning the ignition on, or turning any accessory on. This is to prevent damaging the jumper wire or digital multimeter fuse.

NOTE: The switch knob on the EL 38758 switch is marked ON and OFF. When the switch knob is in the ON position, the circuit is closed and electrical current will pass through the switch. When the switch knob is in the OFF position, the circuit is open and electrical current will not pass through the switch.

1. Vehicle OFF, disconnect the battery negative cable from the battery. Refer to [Battery Negative Cable Disconnection and Connection](#).
2. Turn the EL 38758 switch knob to the OFF position.
3. Install the male end of the EL 38758 switch to the battery ground terminal.
4. Install the battery negative cable to the female end of the EL 38758 switch.
5. Turn the EL 38758 switch knob to the ON position.
6. Road test the vehicle and activate all of the accessories such as the radio and air conditioning.
7. Vehicle OFF, connect a 10 A fused jumper wire to the test switch tool terminals.
8. Turn the EL 38758 switch knob to the OFF position. The current now flows through the jumper wire.
9. Check the fuse in the jumper wire. The fuse should be OK.
 - Failed: If the jumper wire fuse is blown, refer to Circuit/System Testing.
 - Passed
10. Turn the EL 38758 switch knob to the ON position. Remove the fused jumper wire.
11. Connect a digital multimeter set to the 10 A DC scale between the test switch tool terminals.
12. Turn the EL 38758 switch knob to the OFF position. The current now flows through the DMM.
13. As the vehicle systems shut down test for less than 30 mA of parasitic current drain.
 - If greater than the specified range, refer to Circuit/System Testing.

Circuit/System Testing

- NOTE:**
- Removing or installing a fuse, relay, or connector, to determine the area causing high parasitic draw may wake up control modules. You must wait for the control modules to go back to sleep before retesting. It is best to install any removed or disconnected components after the diagnosis is completed.
 - Fuses for power mode master components such as the BCM should be removed last to avoid misdiagnosis.
 - If a scan tool is connected to the DLC, either disconnect it or subtract the scan tool current draw from the DMM reading to get the actual vehicle parasitic current draw.

If the vehicle has an unacceptable amount of parasitic current draw, remove each fuse one at a time until the current draw falls to an acceptable level. A drop of more than 10-20 mA, when disabling a single system or circuit, is an indication of an overly high current draw that could be causing the battery drain. Refer to [Power Distribution Schematics](#) to diagnose exactly which circuit of the suspect system is causing the high parasitic drain. The follow is a list of common components that could cause a high current draw:

- Stuck switch
- Stuck relay
- Control module

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

CHARGING SYSTEM TEST

The accessory power module (APM) supplies the energy that flows between the high voltage (300 volt) direct current (DC) and low voltage (14 volt) DC to charge the 12 volt battery and power accessories. To test the charging system, refer to [DC Power Conversion Test](#).

REPAIR INSTRUCTIONS

BATTERY NEGATIVE CABLE DISCONNECTION AND CONNECTION

Removal Procedure

1. Ensure that all lamps and accessories are turned off.
2. Turn the ignition OFF and remove the ignition key.
3. Disconnect and remove all 12V battery chargers and the AC charger cable from the hybrid battery charger receptacle.

BATTERY POSITIVE AND NEGATIVE CABLE REPLACEMENT (12 V BATTERY TO ACCESSORY DC POWER CONTROL MODULE)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. [High Voltage Disabling](#)
2. Remove Rear Compartment Floor Stowage Trim Compartment [Rear Compartment Floor Stowage Trim Compartment Replacement](#)
3. Disconnect Battery Negative Cable [Battery Negative Cable Disconnection and Connection](#)

5. Install Retainer(2)
6. Lower the vehicle.
7. Connect [Battery Negative Cable Disconnection and Connection](#)

DESCRIPTION AND OPERATION

BATTERY DESCRIPTION AND OPERATION

300 V Battery

For information about the 355 V hybrid drive motor battery, refer to [Drive Motor Battery System Description](#) .

Absorbent Glass Mat Battery

This vehicle is equipped with an absorbent glass mat battery. This is similar to current vehicle lead acid flood batteries, except they use glass mats that absorb electrolytes that are pressed between the plates instead of immersing the plates in electrolytes. This allows a smaller, lighter battery with the same amount of power and is less susceptible to heat.

The maximum permissible voltage allowed for the absorbent glass mat battery is 14.8 V (at room temperature).

12 V Battery

WARNING: Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.

- Follow each step of the jump starting procedure in order.
- Treat both the booster and the discharged batteries carefully when using the jumper cables.

NOTE: Because of the materials used in the manufacture of automotive lead-acid batteries, dealers and service shops that handle them are subject to various regulations issued by OSHA, EPA, DOT, and various state or local agencies. Other regulations may also apply in other locations. Always know and follow these regulations when handling batteries.

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the trash or sent to a landfill.

Batteries that are not part of the vehicle itself, not the battery under the hood, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in repair shops must meet various requirements for ventilation, safety equipment, material segregation, etc.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

Battery Ratings

A battery has 2 ratings:

- Cold cranking amperage
- Amp hours

When a battery is replaced use a battery with similar ratings. Refer to the battery specification label on the original battery.

Amp Hours

The amp hour rating tells you how much amperage is available when discharged evenly over a 20 hour period. The amp hour rating is cumulative, so in order to know how many constant amps the battery will output for 20 hours, you have to divide the amp hour rating by 20. Example: If a battery has an amp hour rating of 74, dividing by 20 = 3.75. Such a battery can carry a 3.75 A load for 20 hours before dropping to 10.5 V. (10.5 V is the fully discharged level, at which point the battery needs to be recharged.) A battery with an amp hour rating of 55 will carry a 2.75 A load for 20 hours before dropping to 10.5 V.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18°C (0°F) while maintaining at least 7.2 V. Refer to the battery specification label on the original battery for the cold cranking amperage rating for this vehicle.

CHARGING SYSTEM DESCRIPTION AND OPERATION

12 V Battery

The following information is for the 12 V battery only.

For information about charging the high voltage drive motor batteries, refer to [**Drive Motor Battery System Description**](#) .

Electrical Power Management Overview

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems. This electrical power management system primarily utilizes existing on-board computer capability to maximize the effectiveness of the charging system, manage the load, improve battery state of charge and life, and minimize the system's impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during Vehicle OFF and during Vehicle in Service Mode. During Vehicle OFF the state of charge of the battery is determined by measuring the open-circuit voltage. The state of charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state of charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. During Vehicle ON mode, the algorithm continuously estimates state of charge based on adjusted net amp hours, battery capacity, initial state of charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state of charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state of charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

Fig. 57: Charging Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K1	K1 14V Power Module
C1	C1 Battery
B18	B18 Battery Current Sensor
K20	K20 Engine Control Module
K9	K9 Body Control Module

Charging System Components

Drive Motor/Generators

The drive motor/generators are serviceable components located within the transmission housing. When the rotors are spun, an alternating current (AC) is induced into the stator windings. This AC voltage is then sent to the drive motor generator power inverter module (PIM) where it is converted to high voltage direct current (DC) power. The output of the PIM is converted into low voltage electrical power by the accessory DC power converter module (APM) for use by the vehicle's electrical system to maintain electrical loads and battery charge.

Body Control Module (BCM)

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management operation. The BCM determines the desired voltage set point and sends the information to the APM. The BCM monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge.

Battery Current Sensor

The battery current sensor is a serviceable component that is connected to the negative battery cable at the battery. The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5 V pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0 - 100 percent. Normal duty cycle is between 5 - 95 percent. Between 0 - 5 percent and 95 - 100 percent are for diagnostic purposes.

Engine Control Module (ECM)

The ECM receives control decisions based on messages from the BCM.

Instrument Panel Cluster

The instrument panel cluster provides a means of customer notification in case of a failure and a voltmeter. There are 2 means of notification, a charge indicator and a driver information center message of SERVICE BATTERY CHARGING SYSTEM.

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulfation Mode
- Normal Mode
- Fuel Economy Mode
- Headlamp Mode
- Voltage Reduction Mode
- Plant Assembly Mode

Battery Sulfation Mode

Battery sulfation mode is used to help maintain the battery life. The charging system will enter a battery sulfation mode which tries to increase the vehicle charging when the charging system voltage is less than 13.2 V for about 30 minutes. Once in this mode, the BCM will set a targeted output voltage between 13.9 - 15.5 V for about 5 minutes. Following this 5 minutes, the BCM will then determine which mode to enter depending on the system voltage requirements.

Normal Mode

The BCM will enter Normal Mode whenever one of the following conditions are met.

- The wipers are ON for more than 3 seconds.
- GMLAN Climate Control Voltage Boost Mode Request is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0Â°C (32Â°F).
- Vehicle Speed is greater than 145 km/h (90 mph)
- Current Sensor Fault Exists
- System Voltage was determined to be below 12.56 V
- Tow/Haul Mode is enabled

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9 - 15.5 V, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the ambient air temperature is at least 0°C (32°F) but less than or equal to 80°C (176°F), the calculated battery current is greater than -8 A but less than 5 A, and the battery state of charge is greater than or equal to 85 percent. Its targeted APM set-point voltage is the open circuit voltage of the battery and can be between 12.6 - 13.2 V. The BCM will exit this mode and enter Normal Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode whenever the high or low beam headlamps are ON. Voltage will be regulated between 13.9 - 14.5 V.

Voltage Reduction Mode

The BCM will enter Voltage Reduction Mode when the calculated battery temperature is above 0°C (32°F) and the calculated battery current is greater than -7 A but less than 1 A. Its targeted APM set-point voltage is 12.9 - 13.2 V. The BCM will exit this mode once the criteria are met for Normal Mode.

Plant Assembly Mode

The BCM will increase charging voltage for the first 500 miles of operation in an effort to ensure that the 12 V battery is fully charged when the vehicle is delivered to the customer.

Instrument Panel Cluster Operation

Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a charging system warning message in the driver information center when the one or more of the following occurs:

- The engine control module (ECM) detects system voltage less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The BCM determines that the system voltage is less than 11 V or greater than 16 V.
- The instrument panel cluster receives a GMLAN message from the BCM indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each Vehicle ON cycle. The indicator illuminates for approximately 3 seconds.
- Vehicle ON, with the engine OFF.

Battery Voltage Gauge Operation

The instrument panel cluster displays the system voltage as received from the BCM over the GMLAN serial data circuit. If there is no communication with the BCM then the gauge will indicate minimum.

This vehicle is equipped with a regulated voltage control system. This will cause the voltmeter to fluctuate between 12 - 14 V, as opposed to non-regulated systems which usually maintain a more consistent reading of 14 V. This fluctuation with the regulated voltage control system is normal system operation and NO repairs should be attempted.

SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the driver information center for the SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is displayed whenever the charge indicator is commanded ON due to a failure.

STARTING SYSTEM DESCRIPTION AND OPERATION

The HQ1 hybrid system does not use a conventional starter. Refer to [Hybrid Modes of Operation Description](#) for information about the starting system.
